TWiki

TWiki is a structured wiki application written in Perl. It was founded by Peter Thoeny in 1998 as an open source wiki-based application platform. It is used as a knowledge or document management system that can be used to create wiki applications using the TWiki Markup Language. It is easy to extend its functionality with plugins. TWiki has an extensive set of features such as access control at the page level, Web level and site level, based on user groups. It also has revision control, a WYSIWYG editor, a plugin API that has spawned over 300 extensions, RSS/Atom feeds, e-mail notification, dynamic content generation, a built-in database, a skinnable user interface, an SQL-like query language to embed reports in wiki pages, support for internationalisation, etc.

Drupal

Drupal is an open source CMS written in PHP, and is used for personal blogs as well as for corporate, political and government sites across the world. It is also known as a Web application framework. It is effective for knowledge management and business collaboration. Other features offered include user profiles management, user management, OpenID support, access statistics and logging, page layout customisation, books, comments, forums and polls. It also allows caching and feature throttling for better performance, systems administration, menu management, advanced search, RSS feeds and a feeds aggregator, support to workflow tools (triggers and actions), localisation built on top of *gettext* - the GNU internationalisation and localisation (i18n) library, auto update notifications for new versions of modules, and themes. Drupal 7 requires PHP 5.2.5 or higher. Drupal supports Web servers such as IIS, Lighttpd, Apache, Hiawatha, Cherokee or Nginx; and databases such as PostgreSQL, SQLite, MongoDB, MariaDB, MySQL, or Microsoft SQL Server.

Joomla!

Joomla is a very popular open source CMS built on a model-view-controller Web application framework, which enables users to build websites and powerful online applications that are easy to use and are extensible. Joomla enables developers to build integrated e-commerce systems, data reporting tools, inventory control systems, custom product catalogues, reservation systems, communication tools, etc.

Other features include user management with nine user groups that have a diverse set of permissions to access, edit, publish and administer; access management with support

Figure 6: Drupal demo

of multiple protocols and methods such as LDAP, OpenID and Gmail; a media manager to manage media files or folders; a language manager that supports most of the world languages; and UTF-8 encoding, banner management, contact management, polls, search and Web link management to sort sites into categories. Syndication and newsfeed management to syndicate site content prior to allowing users to subscribe to new content via an RSS reader, a menu manager to create menus and menu items, template management to make your site's look unique and modifiable, an integrated help system to assist users, powerful extensibility with Joomla Extensions, etc. are some of the core features of Joomla.

Joomla is used to build e-commerce and online reservations portals, small business websites, personal or family home pages, community-based portals, school and church websites, corporate Intranets and extranets, corporate or non-profit websites, online magazines, newspapers and publications, government applications, etc. Some of its famous users are MTV Networks' Quizilla (a social networking platform), Harvard University, Citibank, PlayShakespeare.com, etc.

For installing Joomla 3.x, the requirements are as follows: PHP (Magic Quotes GPC off) 5.4 +, databases such as MySQL (InnoDB support required) 5.1 +, MSSQL 10.50.1600.1+ and PostgreSQL 8.3.18 +; and Web servers such as Apache (with mod_mysql, mod_xml, and mod_zlib) 2.x +, Nginx 1.1 and Microsoft IIS 7.
