

Figure 3: 7-zip

shares per volume; multi-level share directory tree; multi-group-based access control on a per-share basis; multi-host/network-based access control on a per-share basis

Accounts management: Authentication by utilising pluggable authentication modules; Web interface-enabled configuration; it supports network directories such as LDAP, Hesiod, NIS, NT4 domain controller, and Active Directory.

Amanda: A backup and synchronisation solution

Advanced Maryland Automatic Network Disk Archiver, or Amanda, is an open source backup solution that can be used to take backups of data stored on multiple computers over a network. It is written in C and Perl. Windows, Mac OS X, Linux and Solaris are supported operating systems. It is distributed under the GPL, LGPL, Apache and Amanda licences. Amanda is available in two different flavours—the community edition and a fully supported enterprise edition.

Features

- It supports tape-based and disk-based backup
- It supports tape spanning if a backup set does not fit in one tape
- It uses utilities and formats such as dump and/or GNU tar
- It supports multiple simultaneous writes to storage devices

Clonezilla: A backup and synchronisation solution

Clonezilla is a partition and disk imaging/cloning program distributed under the GNU General Public License version 2. It is utilised for bare metal backup and recovery. It comes in two flavours—Clonezilla SE is used for group machine backups and restores, while Clonezilla Live is used for single machine backups and restores. It is written in Perl and UNIX shell. It supports POSIX GNU/Linux operating systems. The minimum system requirements for Clonezilla Live are 196

Figure 4: TrueCrypt

MB of RAM, a CD/DVD drive, a USB port, PXE or hard drive, and an x86 or x86-64 processor.

Features

- File systems supported for Microsoft Windows are: FAT12, FAT16, FAT32 and NTFS
- File systems supported for GNU/Linux are: ext2, ext3, ext4, reiserfs, reiser4, xfs, jfs and btrfs
- File system supported for FreeBSD, NetBSD, and OpenBSD is: UFS
- File systems supported for ESXi are: VMFS3 and VMFS5
- File system supported for Mac OS is: HFS+
- Cloning supported for 32-bit or 64-bit GNU/Linux, MS Windows, Intel-based Mac OS, FreeBSD, NetBSD, OpenBSD, Minix and VMware ESX

Pydio: An online data storage solution

Pydio is an open source tool that is used to utilise a server available on premise or in a cloud environment.

Features

- It provides more control, privacy, a better total cost of ownership and security
- Easy to install
- Easy integration with available employee directory

Libvirt: A storage management solution

Libvirt is an open source management tool for platform virtualisation. It also provides storage management on the physical host in different ways such as storage pools and volumes. A storage pool is a quantity of storage that is used by virtual machines (VMs). Storage pools are divided into storage volumes and assigned to VMs as block devices. Pools and volumes ensure that storage will be available for a VM. Management applications using *libvirt* enable users to allocate storage resources, run the virtual machines, shut them down, de-allocate the resources, etc.
