

A List Of Data Security Solutions Providers

Aujas Networks Pvt Ltd | Bengaluru

The company provides comprehensive data protection services that work across the data's lifecycle. This framework provides a complete offering that includes designing of data-centric policies, data classification, data flow analysis, fine-tuning, consequence management and tools like data loss prevention (DLP), information rights management (IRM/ERM), etc. to ensure effective data protection. Aujas also offers a few accelerators including automated data flow analysis and a repository, a health check assessment tool and a data classification tool to help its clients with comprehensive data protection.

CA Technologies | Hyderabad

CA DataMinder, the company's data protection suite, delivers data security solutions at the endpoint, network, email server and data repositories. Whether it's on-premise, on mobiles or the cloud, its data protection solutions can meet its customers' data security and regulatory requirements while enabling business to continue. These solutions not only prevent information leakage caused by accident or due to malicious intent, but enable business process continuity through precise identity-centric policies. Data protection allows businesses to discover, classify and control sensitive information across all phases of the data's lifecycle—whether the data is in use, in transit, at rest or being accessed.

Globalscape

Continuous Data Protection (CDP) from Globalscape automatically saves a copy of every change to the data. CDP captures all data changes at the byte level, as they occur, and can restore data from any point in time. It provides back-up for multiple locations while minimising bandwidth requirements. Its key features and benefits include real-time updates to backup servers, which allows for easy switchover if the primary file server malfunctions; capabilities for restoring changes to the primary server during switchover periods; the ability to create 'snapshots' or copies of data at any point in time without impacting real-time file use; and being able to restore data through a browser, from disk, or directly over the network, and more.

IBM | Bengaluru

IBM Data Security Services is designed to cost-effectively reduce the risks involved in protecting an organisation's critical data. The firm helps its customers integrate their existing assets and capabilities with new security management technologies. IBM's approach supports collaboration across the enterprise while protecting data both while in transit or when residing on a desktop or in storage. Potential benefits include simplified protection of valuable, business-critical and/or confidential data, controlled data access for collaboration and sharing, protection against corruption, interception with advanced encryption, and reduced risk of regulatory non-compliance.

SafeNet | Noida

SafeNet is one of the market leaders in financial data security for the world's largest financial institutions,
