As most of us know, the Linux Kernel is responsible for resource allocation, low-level hardware interfaces, security, simple communications, and basic file system management in Linux. Created by Linus Torvalds, it aims towards POSIX and Single UNIX Specifications compliance.

This ARM mini-computer is powered by KDE!

Nitrx, the creator of the Compass and Flater icon themes, has come out with the QtBox, a small and portable device measuring just 8.8 cm x 8.8 cm x 8.3 cm, powered by KDE and supposedly quite 'affordable'. The ARM mini-computer might be just the one the market has been waiting for!

Built on entirely open hardware, Nitrx insists the company has gone the extra mile to ensure a great build quality, while offering a mini PC that runs the Nitrx OS 1.0 operating system and uses the eye-candy of the KDE 4.12 desktop environment. The tech specifications include a quad-core 2.0 GHz Exynos 4412 CPU and a Mali 400 GPU. The device features 2 GB RAM, and comes with three internal storage options—8 GB, 16 GB and 64 GB. Connectivity options include Ethernet, 3x USB ports, a micro-HDMI port, a micro-USB port, a 3.5 mm jack and MicroSD slot.

The impressive spec sheet does not necessarily mean a hefty price tag. The QtBox mini-computer from Nitrx is rather very affordable, at US\$ 200 for the 8 GB version, US\$ 225 for the 16 GB model, and US\$ 275 for the 64 GB option. Further, all the options come with an expandable memory of up to 64 GB via MicroSD card. The company has already started taking pre-orders.

Here's a complete 'made in India' 3D printer!

3D printing is rapidly becoming popular all over the world, chiefly among DIYers, researchers and hobby engineers. Well, how could India be left behind? Mumbai's very own Divide By Zero Technologies has come out with the Accura S150, which is a totally 'made in India' 3D printer. With this device, the company wants to take the Indian market, which is still relatively at a nascent stage in terms of the technology, by storm.

The printer ships in the form of a steel box in a sturdy design that can cater to a variety of 3D printing needs. Consuming 700 watts of power and an input of 100-230V AC, the printer is capable of a printing volume measuring 16 cm³. The

Dell's Android-based PC on a stick is now available!

It's been a long time arriving, but it's finally here! Demonstrated over a year ago at the International CES trade show in Las Vegas under the code name 'Project Ophelia', Dell's fancy Android-based Wyse Cloud Connect is finally available. Shipped by Dell at an introductory price of US\$ 129, Wyse Cloud Connect offers users a mobile virtual desktop client.

The device, slightly larger than a USB stick, simply needs a computer display or a TV via MHL or HDMI, a Bluetooth keyboard and mouse, and is good to go! It is powered by a multi-core ARM Cortex-A9 processor and runs Android 4.1. It offers 8 GB of integrated storage that is expandable via a MicroSD card slot. It has 1 GB RAM and supports a maximum resolution of 1080p. Connectivity options include Wi-Fi and Bluetooth.

The Wyse Cloud Connect can be used to play games, watch streaming movies/TV programmes or simply for Web surfing. The advantage here is that you can do stuff you normally do on other Android-based devices with bigger screens.
