

Figure 15: Carousel images

buttons with this plugin.

By giving specific data-attributes to buttons like:

- `data-loading-text='Loading...'`, the button text changes on being clicked.
- `data-toggle='button'` to activate toggling on a single button
- `data-toggle='buttons'` to group of check-boxes/radio for getting similar action on the button groups
- **Collapse:** Includes collapsible actions for accordions, navigations. This plugin has dependency on the *transition.js* plugin

```
<div id='accordion'>
  <div class='panel'>
//Panel 1
    <div class='panel-heading'>Heading</div>
    <div class='panel-body'>Body Content</div>
  </div>
  <div class='panel'>
//Panel 2
    <div class='panel-heading'>Heading</div>
    <div class='panel-body'>Body Content</div>
  </div>
</div>
```

- **Carousel:** A slide-show for cycling through elements is implemented via this generic plugin in the form of a carousel. Options like intervals for automatic scrolling, and pauses for stopping the slider at a particular image can be used as added functionality (Figure 15).
- **Affix:** Integrate the navigation menu with this plug-in and the menu is fixed on the page. Now the navigation can be accessed anywhere, anytime.

By setting the `data-offset` attribute, the menu can be fixed anywhere on the page:

```
<div data-spy='affix' data-offset-top='10px' data-offset-bottom='50px'>
  Navigation Menu
</div>
```

These plugins can be invoked by methods which accept *optional options object* for particular methods and can be initialised with defaults/options/events.

Bootstrap has custom events, which can be triggered before or after the action of the plugins like:

- * `show`: which is used to invoke an event;
- * `shown`: which is used post the plugin action.

In case Bootstrap plugins are used along with other frameworks, then to prevent the name-space collisions, the *.noConflict()* function can be used.

Table 2 gives a summary of the plug-ins we have. **END**
