Abdulrazag Masaher: I want to install Ubuntu along with Windows on my PC but it has not detected any other operating system. Is there anything that can be done?

Like · comment

Richard Tolentino-Ramirez Cabaasag-Ayuyang: Disable EUFI in the BIOS and enable Legacy boot.

Deep Chakraborty: Manually free up space on your hard drive, and during Ubuntu installation, select the option to manually partition drives and create four new partitions in the unallocated space, the / partition, the /swap partition, the /home partition and / boot partition (optional). You'll find recommended sizes online. Install Ubuntu now and after finishing, your computer will probably directly boot into Windows without showing GRUB. Now download and install EasyBCD in Windows and add new entry for linux in the Windows boot loader. Restart and this time it'll probably boot Ubuntu directly on selecting. Now run boot repair from the terminal (follow this link <https://help.ubuntu.com/community/Boot-Repair>), and your Windows entry should get automatically added to the GRUB menu. As you restart, you should be able to see Ubuntu and Windows boot loader on SDA—in the GRUB menu. You are done! If you wish now, you can go back to EasyBCD in Windows and remove the Linux entry (Caution: Don't remove the Windows entry!). This should definitely work, as these are the exact same things I did.

Praveen Klp: Which is more powerful- IPTables or PFsense-or IPCop?

Kartikey LovesXo: I would vouch for PFsense.

Eric Riungu: My vote goes to PFsense.

Jayendra Pratap Singh Hada: Hey, can you guys post some tutorials on how to create Android apps?

Umang Shukla: Please visit <http://developer.android.com/index.html>

GKolya Max Weissman: You may have accidentally deleted your Windows partition and so it's not seeing it because it's not there. You should stay out of the advanced partitioning menu option and choose to install side by side and boot from the Ubuntu DVD to do all of this. Also choose to install Ubuntu rather than try out Ubuntu when presented with that option. Try Linux Mint. It is the sister operating system to Ubuntu. It may work where Ubuntu doesn't. Choose the Cinnamon Desktop version. It should be familiar to anyone who has used Windows XP.

Anand Anand: Utsav Rana: Install GRUB instead of LILO. If you have Windows 8 enabled PC, please make one partition same as /boot partition that will be named as BIOS boot reserved area. Just make sure that you are not formatting the NTFS drive by mistake.

Daniel Chakraborty: Try Puppy Linux, Tails or even Light-weight Portable Security. They run off a pen drive with no need for installation. Ubuntu works well without installation in the same way at least for basic tasks. Keep Windows installed on your hard drive.

An Kit: Guys, I am new to Ubuntu, have installed Ubuntu 13.10 on my Dell Inspiron. I have tried for hours and still can't get the WiFi work on my PC. Please help!

Craig Nicholson: I ran into issues with Broadcom card and Fedora 19 & 20 installs. It was resolvable though. Send me a message and also post on my wall so I know the message shows up (Facebook no longer displays a message icon if you're not friends unless you're willing to pay for your message)

Steve Jeffries: I'd like to use Linux on my laptop but had trouble getting flash player and or Shockwave when I used it on my PC. Has anything changed in the last 12 months?

Ian Walker: On Fedora 20 I installed VLE via RPM Fusion & yum (which doesn't have much to do with the question) and then used yum to install the Adobe RPM's & Flash player then tested it on Mozilla. Pretty easy stuff if you know how to call it a terminal.

Ian Walker: Shahbaz Khan: Yes Adobe flash player is available for Linux, but unfortunately Adobe will not develop any newer version for Linux after version 11.
