

chief executive officer for Microsoft was quoted as saying during the official announcement.

The Office Mobile is now completely free and can be used to view and edit Word documents, Excel spreadsheet or PowerPoint presentations. Earlier, Office Mobile only allowed users to view Office documents. Consumers needed an Office 365 paid subscription in case they wanted to edit the documents.

Microsoft has also released an open source SDK for Office 365. Coming from Microsoft Open Technologies, the company's open source subsidiary, the SDK for the Android platform has been released under the Apache License, version 2.0.

A new podcast manager app for Linux

Here's some good news for all those who endlessly crib about Linux lacking a decent app for managing podcasts. The upcoming podcast manager called Vocal is certainly not a new concept; however, its developer might beg to disagree. For Nathan Dyer, the app will do away with the 'clunky, bloated and unnecessarily complicated flaws' prevalent in the current breed of apps.

Boasting of sheer simplicity, the app has all the essentials efficiently covered: streaming and downloading, supporting video and audio podcasts, automatic checking for new episodes and downloading them as and when they're released, etc.

An initial beta release of the app is expected to arrive by the end of June this year. And if you're looking to stream torrents to your computer, a new open source application called Popcorn Time will let you stream Torrent movies in Linux, as well as on Windows and OS X. This application, a first of its kind, is for those who are too impatient to wait for a Torrent to download.

Minnowboard Max is Intel's new open source single-board computer

Adding to the current crop of fully open source devices, Intel has now gone ahead and released its much anticipated US\$ 99 Minnowboard Max, which is a tiny single-board computer that runs Linux and Android. The open source computer is powered by a 1.91 GHz Atom E3845 processor and the tantalising price tag is clearly expected to be a major crowd puller.

The Minnowboard Max doesn't directly compete with the Raspberry Pi. The new device will help DIYers/hackers to mess around in x86 architected systems at an affordable price. The Minnowboard Max comes with break-out boards called 'Lures' to expand functionality. Also, the graphics chipset comes with open source drivers. Intel aims to resurrect its low-power Atom processor by readily 'giving it' to hackers (owing to the meagre price), making it relevant once again.

Raspberry Pi, on the other hand, runs a Broadcom system-on-chip with a 700 MHz ARM processor.

Vine rolls in direct messaging; now competes with Instagram

Short video sharing smartphone app Vine has rolled out a new update for both Android and iOS platforms.

Instagram

The new update enables users of the app service to send and receive Vine messages integrated with videos. This new direct messaging feature competes with apps like Instagram.

According to reports, Vine is a short video-sharing-based social network that lets users upload, browse and watch short video clips on mobile phones.

The new Vine messages can now be sent as text, video, or both, to one or more contacts, simultaneously. The app offers two divisions in its message window, marked as 'friends' and 'others', to differentiate between contents.

The new update allows the Vine app users to change their profile colours, as well. They can switch the colour pattern of their profiles with colour tones given in the update.

This new message feature is already available in apps like Instagram, wherein users can send videos, images and text to friends via Direct Messages.
