

```

6 | ERROR | There must be a single space between the closing
parenthesis and
|         | the opening brace of a multi-line IF statement;
found newline
8 | ERROR | Line indented incorrectly; expected at least 4
spaces, found 0
-----

```

It generates the above coding standard errors. By default, it checks the code against PEAR coding standards. To know more about the PEAR coding standards, refer to: <http://pear.php.net/manual/en/standards.php>

Correct the above errors and again check the coding standards. After correction, the file looks as follows:

```

<?php
/**
 * Sample PHP file for coding standard demo
 *
 * PHP version 5
 *
 * @category CategoryName
 * @package PackageName
 * @author Original Author <author@example.com>
 * @license GNU General Public License http://www.gnu.org/licenses/gpl.html
 * @link http://foobar.com
 */

$mark = 20;
if ($mark < 30) {
    echo "Need hard work";
} else if ($mark > 30) {
    echo "Good work";
}
?>

```

Similar to PEAR coding standards, there are many other standards also defined as sniffs.

- To list all of them, use the following commands:

```
#phpcs -i
```

The installed coding standards are Zend, PHPCS, MySource, Squiz, PEAR, PSR2 and PSR1

- To check the code against particular coding standards, use the following command:

```
#phpcs --standard=Zend,PEAR <filename>
```

- You can get reports in different formats based on your requirements:

```
#phpcs --report=<report_type> <file_name>
```

The *report_type* can be any one from the following list:

summary, source, checkstyle, csv, emacs or svnblame

- To get help on available options, use the following command:

```
#phpcs -h
```

Creating your own collection

Your requirements may be different from the existing collection of coding standards. So, pick the standards from the existing collection and create your own new rule set. You can also provide configuration values for the standards.

You can explore the directory to know the available standards. All the defined Sniff classes have detailed PHP doc comments. To list the name of the available coding standards, use the following command:

```
$ find ./ -name "*Sniff.php" -and -not -name "Abstract"
```

You can follow the sample rule set *xml* with self-explanatory comments:
