

Figure 1: Zotonic admin module

Mapping of URLs to the Erlang modules is specified in the file `dispatch` along with the parameters needed, if any. For example, you could specify the template to be used here. Zotonic, like Web Machine, also uses the `erlydtl` templates, an implementation of Django Template Language in Erlang.

In the sites directory, you will also find `zotonic_status`, which includes default templates and CSS files that are available for use on your site. For example, the file `basesite/templates/home.tpl` determines what is shown, and where, on the home page of the basesite. It includes and uses templates that are available in the `zotonic_status` site.

The templates can access system entities using pre-defined models, e.g., the main resource model or search model. These are used as `m.rsc.x` or `m.search.x` in the templates. You can refer to the in-depth manuals on <http://zotonic.com/docs/> for more details.

As you may have deduced from this quick overview, Zotonic makes it possible to create a CMS site without having to write any Erlang code.

However, since the modules available may not meet all your needs, you may want to write a custom module, which we will explore next month.
