

which is often a research institution.

For any academic institution like a university, it includes digital content such as academic journal articles. It covers both preprints and postprints undergoing peer review, as well as digital versions of theses and dissertations. It also includes some other digital assets generated by academics, such as administrative documents, course notes or learning objects. Depositing material in an institutional repository is sometimes mandated by institutions.

Some of the main objectives of an institutional repository are: to provide open access to institutional research output by self-archiving it, to create global visibility for an institution's scholarly research, and to store and preserve other institutional digital assets, including unpublished or otherwise easily lost literature such as theses or technical reports.

Classically, a repository is a digital 'archival' system. The orientation is towards long-term storage, digital preservation and accessibility of completed content. The focus is on ensuring and maintaining provenance of completed or published content. A repository is majorly used for scholarly and/or published content, and tends to follow the latest library/archival best practices.

Digital Repository Management Systems (RMS)

Archimede

URL: <http://www1.bibl.ulaval.ca/archimede/index.en.html>
Created at Laval University Library, Archimede is an open source program for building institutional archives. It offers English, French and Spanish interfaces. With an accent on internationalisation, the product's interface is autonomous and not implanted in the code. This permits you to create a particular interface with an extra dialect without re-coding the product itself. It likewise lets clients switch from dialect to dialect "any place and whenever" while looking for and recovering content.

Availability

- Free, open source software, delivered under the GNU General Public Licence
- Download Archimede software from SourceForge: <http://sourceforge.net/projects/archimede>

Features

- Inspired by the DSpace model, it uses communities and collections of content
- The search engine is based on the open source Lucene, using LIUS (Lucene Index Update and Search), a customised framework developed at Laval by the library staff
- OAI compliant
- Uses a Dublin Core metadata set
- User
- Laval University Library

CDSware (CERN Document Server Software)

URL: <http://cdsware.cern.ch>

Developed by CERN, the European organisation for nuclear research that is based in Geneva, CDSware is designed to run an electronic preprint server, online library catalogue or a document system on the Web.

Licence and availability

- Free, open source software distributed under the GNU General Public License
- Download location: <http://cdsware.cern.ch/download/>

Features

- OAI compliant
- MARC 21 metadata standard
- Full text search
- Database: MySQL
- Extensibility: API available
- Powerful search engine with Google-like syntax
- User personalisation, including document baskets and email notification alerts

User

- CERN document server: <http://cdsweb.cern.ch/>

At CERN, CDSware manages more than 400 collections of data, consisting of over 600,000 bibliographic records, including more than 250,000 full text documents.

CONTENTdm

URL: <http://contentdm.com>

Developed at the Centre for Information Systems Optimization (CISO) at the University of Washington, and maintained by Digital Media Management Inc (DiMeMa), "CONTENTdm offers scalable tools for archiving collections of any size. These tools are designed with minimal support requirements and maximum flexibility. CONTENTdm is used by libraries, universities, government agencies, museums, corporations, historical societies, and a host of other organisations to support hundreds of diverse digital collections." Lots of Copies Keeps Stuff Safe (LOCKSS) (Stanford University)

URL: <http://www.lockss.org>

LOCKSS is the open source and peer-to-peer software that functions as a persistent access preservation system. Information is delivered via the Web and stored using a sophisticated but easy-to-use caching system. LOCKSS provides librarians with an easy and inexpensive way to collect, store, preserve and provide access to their own, local copy of authorised content they purchase.
