EPrints

URL: <http://software.eprints.org>

GNU EPrints is free, open source software developed at the University of Southampton. It is designed to create a preprint institutional repository for scholarly research, but can be used for other purposes. EPrints was created so that the institutions are able to create OAI-compliant archives quickly, easily and at no cost. OAI-compliance implies that all archives created in this way are "...interoperable. It uses the same (OAI) convention for tagging metadata (author, title, date, journal, etc). That means the contents of all such archives can be harvested, integrated, navigated and searched seamlessly, as if they were all in one global 'virtual' archive. The main objective of the EPrints software is to help in creating open access to the peer-reviewed research output of all scholarly and scientific research institutions or universities." (Source: <http://software.eprints.org>)

Availability

- Distributed under the GNU General Public License
- Download software at <http://software.eprints.org/download.php>
- Demo server: <http://software.eprints.org/demo.php>

Features

- Any content type accepted
- Archive can use any metadata schema
- Web-based interface
- Workflow features: content goes through moderation process for approval, rejection or return to author for amendment
- MySQL database
- Extensible through API using Perl programming language
- Full text searching
- RSS output

Users

- California Institute of Technology
- CogPrints Cognitive Science Eprint Archive
- Digitale Publikationen der Ludwig-Maximilians-Universität München
- Glasgow ePrints Service
- Institut Jean Nicod - Paris
- National University of Ireland (NUI) Maynooth Eprint Archive
- Oxford EPrints
- Psycology
- University of Bath
- University of Durham
- University of Southampton

Fedora (Flexible Extensible Digital Object Repository Architecture)

URL: <http://www.fedora.info>

Developed jointly by the University of Virginia and Cornell

University, Fedora (Flexible Extensible Digital Object Repository Architecture) serves as a foundation for building interoperable Web-based digital libraries, institutional repositories and other information management systems. It demonstrates how you can deploy a distributed digital library architecture using Web-based technologies, including XML and Web services.

Fedora is a digital asset management (DAM) architecture upon which institutional repositories, digital archives and digital library systems might be built. It is the underlying architecture for a digital repository, and is not a complete management, indexing, discovery and delivery application. It is a modular architecture built on the principle that interoperability and extensibility are best achieved by the integration of data, interfaces and mechanisms (i.e., executable programs) as clearly defined modules.

Licence and availability

- Free and open source
- Distributed under the Mozilla open source licence
- Information on future releases of Fedora Phase 2 available at: http://www.fedora.info/documents/fedora2_final_public.html
- Download the current release, Fedora 1.2.1 at <http://www.fedora.info/release/1.2/>

Features

- Any content type accepted
- Dublin Core metadata
- OAI compliant
- XML submission and storage
- Extensibility: APIs for management, access and Web services
- Content versioning
- Migration utility
