

publishing it on the Internet or on CD-ROM....” (Source: www.greenstone.org/factsheet)

License and availability

- Free multilingual, open source software
- Distributed under the GNU General Public License

Features

- Multilingual: Four core languages are English, French, Spanish and Russian. Over 25 additional language interfaces are available
- Includes a pre-built demonstration collection
- Offers an ‘Export to CD-ROM’ feature

Users

- Books from the Past/ Llyfrau o'r Gorffennol
- Gresham College Archive
- Peking University Digital Library
- Project Gutenberg at Ibiblio
- Texas A&M University: Center for the Study of Digital Libraries
- University of Applied Sciences, Stuttgart, Germany

DSpace

URL: <http://www.dspace.org>

DSpace is a digital library system that is designed to capture, store, index, preserve, and redistribute the intellectual output of the university's research faculty in digital formats. It has been developed jointly by HP Labs and MIT Libraries.

License and availability

- Free, open source software
- Distributed through the BSD open source licence
- Download at <http://sourceforge.net/projects/dspace/>

Features

- All content types accepted
- Dublin Core metadata standard
- Customisable Web interface
- OAI compliant
- Workflow process for content submission
- Import/export capabilities
- Decentralised submission process
- Extensible through Java API
- Full text search using Lucene or Google
- Database: PostgreSQL or SQL database that supports real time transactions such as Oracle, MySQL

Users

- Cambridge University
- Cranfield University
- Drexel University
- Duke University
- University of Edinburgh
- Erasmus University of Rotterdam
- Glasgow University
- Hong Kong University of Science & Technology Library
- Massachusetts Institute of Technology
- Université de Montréal (Erudit)
- University of Oregon

Installation of DSpace on Ubuntu 12.04

To install prerequisite applications, type *Open Applications > Accessories > Terminal* and execute the following command:

```
sudo apt-get install openjdk-7-jdk
sudo apt-get install taskset
sudo taskset
```

Select the following packages. Use the space bar for selecting applications from the list.

- LAMP server
- PostgreSQL database
- Tomcat Java server

Use *Tab* to select the OK button and press *Enter*. The packages will start to install.

In the process, you will have to give MySQL a root password, though MySQL is not necessary for Dspace installation:

```
sudo apt-get install ant maven
```

Create the database user (dspace):

```
sudo su postgres
createuser -U postgres -d -A -P dspace
Enter password for new role (select a password like dspace)
Shall the new role be allowed to create more new roles? (y/n) n
```

Type *exit* to exit from the prompt.

Allow the database user (dspace) to connect to the database. [If the following command does not open, check the PostgreSQL version number and apply it in the command.]

```
sudo gedit /etc/postgresql/9.1/main/pg_hba.conf
```

Add this line to the configuration file at the end:

```
local all dspace md5
```

Save and close the file.

Restart PostgreSQL:

```
sudo su enter,
```

...then paste the following line and press *Enter*.

```
/etc/init.d/postgresql restart
```

Create the UNIX 'dspace' user, update the *passwd*, create the directory in which you will install DSpace, and ensure that the UNIX 'dspace' user has write privileges on that directory:

```
sudo useradd -m dspace
sudo passwd dspace (enter any password like dspace for the
```
