

Get to Know the **Etherios Cloud Connector**

Etherios Cloud Connector allows you to seamlessly connect any M2M device to Device Cloud by Etherios.

Device Cloud is a device management platform and data service that allows you to connect any device to any application, anywhere. As a public cloud service, it is designed to provide easy integration between devices and the Device Cloud by Etherios to facilitate real-time network management and rapid M2M application development. It is simple to integrate client software, Web applications or mobile applications to Device Cloud, using Etherios Cloud Connector and open source APIs.

Device Cloud security

The Etherios Cloud Security Office fiercely protects the confidentiality, integrity and availability of the Device Cloud service. With over 175 different security controls in place that take into account security frameworks including ISO27002's ISMS, NERC's critical infrastructure protection (CIP)

guidance, the payment card industry's PCI-DSS v2, the Cloud Security Alliance's (CSA) Cloud Controls Matrix, as well as relevant HIPAA and NIST standards, Device Cloud customers are assured that there is no safer place for their data.

Etherios Cloud Connector

Etherios Cloud Connector is a software development package that is ANSI X3.159-1989 (ANSI C89) and ISO/IEC 9899:1999 (ANSI C99) compliant and enables devices to exchange information with Device Cloud over the Internet, securely.

The devices could range from Arduino boards and Freescale or Intel chips, to PIC or STM microcontrollers, a Raspberry Pi microcomputer or a smartphone.

Etherios Cloud Connector enables application-to-device data interaction (messaging), application and
