

## Opera Mini Web browser powers Samsung Gear S

Opera Mini has become the first Web browser on Samsung's Gear S, the Tizen-based wearable device platform. Users of this new smart watch will be able to enjoy Web browsing from their wrists. Opera Software has recently announced. With more than 250 million monthly users around the world, Opera Mini is known for its compression technology that shrinks the size of Web pages to sizes that are just 10 per cent their original. The result is a faster and more energy-efficient browsing experience. It helps to load image-heavy pages in a snap, with finger-friendly features for small-screen Web browsing. The Smart Page gives users all their social updates and the latest news on one screen. Opera Mini's speed dial features website shortcuts as large buttons, enabling Gear S users to reach their favourite sites in a single tap. Private browsing removes any trace of the Web pages visited on the device.

## SUSE and MariaDB expand Linux ecosystem on IBM POWER8

SUSE and MariaDB Corporation (formerly SkySQL) have announced a partnership that expands the Linux application ecosystem on IBM Power systems. As a result, customers can now run a wider variety of applications on POWER8, increasing their flexibility and choice while working within their existing IT infrastructure. The partnership was unveiled at IBM Enterprise 2014, supporting the US\$ 1 billion investment to be spent over the next five years to develop Linux and open source technologies on IBM Power systems. This is the first of several partnerships to be announced by SUSE with the upcoming release of SUSE Linux Enterprise 12—the latest version of the most interoperable platform for mission-critical computing across physical, virtual and cloud environments. MariaDB Enterprise will be optimised for SUSE Linux Enterprise Server 12 on IBM POWER8-based servers.

issues with Ubuntu GNOME has been that the distro doesn't integrate the new packages that are released as things are not as simple as they seem. Ubuntu GNOME is very much an official flavour of the Ubuntu ecosystem and the developers need to follow a strict release schedule. One of the most important steps is 'feature freeze'. This is a point in the

cycle where all the new features and major modifications for the system stop and the developers focus on bug fixes only.

## Here comes the Linux 3.17 kernel and it fixes the UNIX 2038 bug

Linus Torvalds has kept the 'Shuffling Zombie Juror' code name for Linux 3.17, which finally got released with lots of great features and is being considered

a big improvement by experts. Hence, Linux 3.17 must be called a very exciting update and for any avid Steam user, this release allows controllers to get connected to desktops via Microsoft Xbox One controller support, without any vibration. In addition, the open source NVIDIA driver has also received several improvements. Distros like

Arch, Fedora, Korora and Manjaro, which are open to frequent updates, are expected to get the Linux 3.17 update soon. The release fixes the UNIX 2038 bug, which was slated to impact Linux systems after 24 years (in 2038), much like the worries related to Y2K (in year 2000 -- a flaw that was only fixed on many systems in 1999). Linux 3.17 contains only this one patch to fix the UNIX 2038. The addition of memory fences is certainly an important feature in Linux 3.17. Linux kernel developer, David Herrmann has sent out mailing lists that explain
