

The Best Features of Google's Android 5.0 Lollipop

Since the preview, Google has added lots of new features to the final release of the latest Android version. Let's take a look at the top 10 features of the much-awaited Android 5.0 Lollipop.

Back in June, Google previewed and teased us with Android L at the Google I/O developer event and ever since then, the final version has been awaited with much eagerness. Finally, on October 15, Android 5.0 Lollipop was launched on devices like Nexus 6, Nexus 9 and Nexus Player. Since the preview, Google has added lots of new features to the final release of this new Android version. Let's look at its top 10 features.

1. Material Design: a new design language

Google's last design language was *Holo*, which was replaced by *Material Design*, which has been used in Android L. Google has been continuously updating its design guidelines for developers to start making *Material Design* apps. With Lollipop, Google is focusing on the main thing – Android's consistency across all devices. Android Lollipop will be omnipresent across phones, tablets, watches, cars and TVs too. Lollipop will have a flat look for its UI and all icons. The *Material Design* means menus

will respond more promptly. So Android Lollipop is all about a consistent design experience across all Android devices and with this design, elements can dynamically shrink and expand. Most importantly, the interface has a 3D appearance overall.

2. Battery life fixes

Google has added a new battery saver feature to the latest Android version, which claims to extend the battery life of devices up to 90 minutes. This Android version will display the estimated time left to fully charge the device when plugged in and also the time left before the user needs to recharge the device. Android phones have always suffered from battery life issues due to apps and services running in the background. The power-saving mode has been missing from older versions of Android. You'll be able to restrict syncing, background data and also screen brightness to extend battery life. The power-saving mode has been tuned in a better way to the Android 5.0
