

Lollipop. The battery use menu has got a better graph, which informs users which apps are draining the battery. More battery life is always welcome so Android Lollipop is a winner for millions of Android users across the globe.

3. Notification settings

Android 5.0 Lollipop has lock-screen displays and rich notification settings. Users can view and respond to messages directly from the locked screen, and the richer notification settings in the new Android version include floating descriptive notifications on the top of activities. These notifications can be viewed or dismissed without moving away from any activity. On Android Lollipop, Google has offered better control over notifications. Users can control notifications from apps and sensitive content can be kept hidden. The 'Priority mode' can also be turned on via the volume button of the device. There is one more feature called the 'Do Not Disturb' mode, just like in Apple's iOS, which allows users to selectively silence notifications and calls. The entire look and feel of the notifications is changing as lock-screen can be easily accessed now, along with a revamped pull-down menu. The layout and location of the notifications have been completely changed and lock-screen widgets have been removed from Android 5.0.

4. Security enhancements

Android 5.0 will allow encryption, by default. You can encrypt your Android device even now, but it's a painstaking job. You need to plug in your phone and the encryption process takes a minimum of 30 minutes. And just to warn you, if anything goes wrong, your data will be lost. But with Android 5.0, encryption will be automatic. Android 5.0 features an opt-in kill-switch known as 'Factory Reset Protection' which allows users to wipe out the device's data, if they wish to. With this Android version, you can also unlock your phone in an easier way without entering a PIN or drawing the pattern. You can use an Android watch to unlock your phone, which is kept in close proximity. Lollipop also comes with SELinux enforcement, which means better protection against viruses and malware.

5. New quick settings

Google wants to curb swipes on devices that are needed to access important functions like Wi-Fi, Bluetooth and GPS activation. The new Android includes built-in tools for the flashlight, hotspot and screen cast controls, which means you can get rid of many third party apps now. Setting up an Android device will become faster with Android 5.0, as the new device can be set up just by tapping it on the old device, though this requires NFC support. All apps from Google Play will be transferred to the new device, if the same Google account is used. In certain situations, you can also adjust brightness, manually.

6. A new messenger app

There is a new messenger app in Android 5.0, which comes with Nexus 6 and is said to be a simplified version of Google

Hangouts. This messenger has been designed for sending and receiving SMS and MMS messages on Android in a quicker and easier way. More updates about this messenger are still awaited though.

7. Performance boosts

Android 5.0 supports 64-bit and the new Nexus 9 also features a 64-bit chip, though Nexus 6 doesn't. Well, this kind of performance boost will not make a very huge difference for average users but Google will be shipping native 64-bit versions of Gmail, Maps and other apps too. But this development will not mean much if you are using a 32-bit device. The runtime environment in the new Android version is ART, which promises four times better performance and better desktop level graphics performance too.

8. An updated camera

The updated camera settings support advanced features like burst mode and fine-settings tuning. Full resolution frames around 30fps can be captured in this new update and shooting can be done in raw formats like YUV and Bayer RAW. Android 5.0 also supports UHD 4K video playback, tunneled video for high quality video playback on Android TV and improved live streaming. Professional features have also been added like controlling settings for the sensor, lens and a flash, per individual frame. In Android 5.0, developers will be able to implement their own technology to take full advantage of hardware and any mediocre camera can be transformed to a better one.

9. Device sharing

Device sharing features have been integrated in Android 5.0, which allow users to share their device with family members and friends without giving access to sensitive content. It features a guest user mode with custom options for access, which allows users to fix the place of the screen that is displayed. There is also a feature in Lollipop that allows users to log in to another Android phone to access synced messages and content, if the device is forgotten at home.

10. Other updates

There are some more features in this OS besides other fixes and improvements. In this new OS, finding things will become easier with improved search indexing, and search results will be saved across different apps and devices.

Other relevant features of Android 5.0 include improved hardware keyboard accessory support, support for 15 new languages including Bengali, Kannada, Malayalam, Marathi, Tamil and Telugu, improved audio and video capabilities, and improved Internet connectivity with more powerful Bluetooth low energy capabilities.
