

three important sections, namely, the header, content and footer, as shown below:

```
<div data-role="page">
<div data-role="header"> </div>
<div data-role="content"> </div>
<div data-role="footer"> </div>
</div>
```

Notice that in the above code snippet we used something called 'data-role'. It specifies which div/block should be used for the page, header, content and footer. Data-role assigns roles to regular HTML elements.

Now let's add some content to our 'page', 'header', 'content' and 'footer' to make a mobile Web app. First, add some theme to our 'page' using the data-theme:

```
<div data-role="page" data-theme="b"> or <div data-
role="page" class="ui-bar ui-bar-e">
```

jQuery Mobile supports some powerful themes. jQuery provides its own themes or, if needed, you can create your own theme. More information about themes can be found at <http://themerooller.jquerymobile.com/>.

Making our list of items searchable

Listview can be an ordered or unordered list on a page with at least one item in it. jQuery Mobile renders lists for touch devices and it automatically occupies the whole width of the page. Listview may also contain item separators, multiple lists and, most importantly, it must be made searchable.

Inside the `<ul>` tag, add `data-role="listview"` with `data-insert="true"` to specify whether the element should be within content margins or outside of them. Once Listview is added, look at the search box above the list. This can be used to search any of the listed items. Try searching some country's name in the search bar after adding Listview.

```
<ul data-role="listview" data-insert="true" data-
filter="true">
```

Format the footer

Now that our header, content and search bar is looking good, let's add a footer to our page using `data-role="footer"`, `data-position="fixed"` (this attribute is used to keep the footer position fixed) inside the `<div>` tag.

```
<div data-role="footer" data-position="fixed" data-theme="e">
```

Last of all, add `data-role="navbar"`. jQuery mobile provides a number of icons that can be used with the `"data-icon"` attribute or class named `"ui-icon-"`. jQuery provides both PNG and SVG images of icons. For example, the following will display the home icon at the footer (for more

Figure 2: Final app

information on icons, refer to <http://api.jquerymobile.com/icons/> and upon clicking the Home button, it will navigate to the first page using `href="#MainPage"`.

```
<nav data-roles="navbar">
<ul>
<li><a href="#MainPage" data-icon="home">Home</a></li>
<li><a href="#settings" data-icon="gear">Settings</a></li>
</ul></nav>
```

Building a simple Web app

Now that we have some basic understanding of jQuery Mobile's page structure, let's create a simple app (Figure 2).

The complete code for our app follows. (Add the `<script>` code given below after defining jQuery Mobile library files.)

```
<head><script> <!-- JQuery script for our HTML5 code -->
$(document).ready(function){
var loc = window.location.href;
$("#li").click(function){
var country = $(this).attr("id");
$("#FlagImage").attr("src", function (i,origValue){
return "images\\" + country + "-flag.jpg";});
$("#FlagDescription").text ("This is " + country.
toUpperCase () + " Flag");
$("#FlagHeader").text (country.toUpperCase () + " " +
"Flag");
newURL = loc + "#FlagPage";
$(location).attr('href',newURL); });}); </script></head>
<body>
<div data-role="page" data-theme="a" id="MainPage">
<header data-role="header" data-theme="b">
<h1>National Flag</h1>
</header><!-- /header -->
<div data-role="content" data-theme="d">
```
