

Figure 3: Follow SSL stream

A word of caution

Packets captured using the test scenarios described in this series of articles are capable of revealing sensitive information such as login names and passwords. Using ARP spoofing, in particular, will disturb the network temporarily. Make sure to use these techniques only in a test environment. If at all you wish to use them in a live environment, do not forget to avail explicit written permission before doing so.

techniques, DH and RSA only to enable a basic understanding of the topics. For those who want to know more, please search the Web, especially Wikipedia.

An interesting note: Websites using the https protocol are called 'secure' websites only to the extent that the communication between browser and Web server is encrypted and, further, the server is authenticated by CA – but nothing beyond that! It does not guarantee that the Web applications or the site is secure enough.
