Figure 6: Upgrading *oh-my-zsh*

it expands till `cd /usr/l`, before asking you if you mean *lib* or *local*, as there is a chance of either being the right choice.

Command history: This is one of the most important features. In *bash*, if we type some command and press the up arrow a number of times, we get the whole history. But in *zsh*, if we type a command and use the arrow button, we only get the commands that have the specific command in it. As an example, the order in which we typed the commands is shown below:

```

cat /etc/passwd
cd ~
cd /root
cat

```

In *bash*, if we type ‘`cat`’ and then the arrow key, we get `/root` but in *zsh*, we go directly to the `cat /etc/passwd` as *zsh* gives the history of the specific command.

Sharing history across sessions: If you are running two different *zsh* sessions, whatever command we typed last can be shared with any of the other terminals with *zsh*. This can't be done in *bash*.

Extended globbing: Globbing means the use of ‘*’ to match all the items—in *zsh*, we can use ‘***’ to match even the directory that is located very deep.

Easy scripting: With *zsh*, we can do shell scripting very easily because it has a more tolerable syntax. (Even though I don't recommend using it as it is not installed in every machine by default. But it can be used locally for daily work if one is too lazy to type a particular instruction every day).

Aliases: By default, *zsh* has many aliases, which are mainly typing errors.

Many other features: *Zsh* supports many other features such as *git* completion, the built-in *less* command, etc. *zsh*, along with the configuration of *oh-my-zsh*, turns into a powerful tool and makes the command line interface more friendly.

Note: Some themes in *oh-my-zsh* may not work in a proper manner. So you can report the problems at <https://github.com/robbyrussell/oh-my-zsh/issues>

Uninstalling *zsh/oh-my-zsh*

Zsh is a very good shell that you may not be interested in uninstalling. In case you don't like the *oh-my-zsh* configuration, you can uninstall it using the simple command shown below:

```
uninstall_oh_my_zsh
```

This removes the *oh-my-zsh* and restores the *.zshrc* which was configured before installing *oh-my-zsh*. If you don't want *zsh* at all, then you can run the following command:

```

sudo apt-get remove zsh
sudo apt-get remove --purge zsh

```

Note: If even after using the above commands the configuration files in *.zshrc* do not get removed, you need to remove them manually by using `rm -rf ~/.zshrc`, or by using `Ctrl+H` (to show the hidden files in Nautilus) and pressing `Shift + Delete` (to delete them permanently without saving them to Trash)
