

IBM brings Linux to its Power System servers

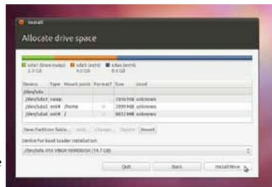

IBM has installed Linux on its Power System servers in the company's 54 centres across the globe. Earlier this year, the company announced plans of investing billions of dollars on the Linux platform. IBM will be training developers to build applications on Linux systems. Developers can use Ubuntu, Red Hat Linux and SUSE Enterprise Server to access parallel processing and virtualisation features.

IBM also announced a few new services recently at LinuxCon, which are expected to be run on the Power Server environment. The OpenPower Foundation has made Power System architecture open source. Developers can access the source code for the software and designs for hardware solutions. These services are better than generic servers in data centres. IBM claims that they are the best tools for data analytics and cloud computing. These services will help IBM to expand Power System expertise in various sectors. IBM can finally focus on the untapped market segment of high performance, efficient and effective big data analytics. This move will also reduce the use of software and hardware resources at data centres.

Ubuntu Installer bug formats the entire hard drive!

Installing a new OS on your PC is never a risk-free task. There is always a huge threat to your data. Hence, it's recommended that you back up your hard drive before installing any OS. Many users have filed reports regarding the 'Reinstall Ubuntu' option in the Ubuntu Installer over the past one year. According to these reports, the 'Reinstall Ubuntu' option secretly wipes the data in other partitions of the hard drive. It also wipes out recovery images and other operating systems. This option is supposed to overwrite the existing Ubuntu installation only. Ubuntu Installer warns users that it will delete all Ubuntu programs, documents, photos, music and any other files, which creates confusion since users think that it will delete the data residing only on Ubuntu. Hence, there is the need for a clear warning from Ubuntu Installer to avoid losing data.

The MIPS Creator C120 board, a Raspberry Pi-like dev board for hackers

There is a new entry among open source developers' boards—the MIPS

LibreOffice 4.3.1 released with 100 bugs fixed

The free, power-packed, open source, personal productivity suite called LibreOffice has been updated to a new version and it's ready for use on Windows, Mac OS and Linux. The release of LibreOffice 4.3.1 has been announced by The Document Foundation (TDF). With this new update, 100 bugs have been fixed successfully. These fixes include RTF improvement, enhancement to OOXML file handling, and improvement in both RTF and OOXML files import. The background colour of the Writer word processing app has been slightly lightened and also improved for overall stability and performance. Two essential security patches have been included and they have been backported to the older 4.2.x series. This updated version includes six feature-rich applications: Writer, Calc, Impress, Draw, Math and Base.

Easily add videos to WordPress with the new VideoNab plugin

PaperTelevision—one of the many start-ups emerging from Cincinnati, Ohio in the US—has proudly announced a new WordPress plugin titled VideoNab. Yes, they seem to be fond of mashing two words together and randomly capitalising letters in order to form a new word. VideoNab is a powerful WordPress plugin that scours YouTube for videos on any topic. Though the results are spectacular, the concept itself is simple: set the topic, choose a schedule for how often new videos are 'nabbed', and VideoNab's filtering and aggregation software handles the rest. Set it, forget it, and the site is suddenly an automated machine of constant, fresh video content. Users can refine the settings to include comments for each video, design customisations, share them across all social media, and even use an integrated voting system—a nice touch for hosting contests, or simply allowing visitors to rate their favourite videos.
