

Unotech helps Mahindra & Mahindra Financial Services Limited to optimise 87 per cent of its proprietary field force solutions

Unotech Software Pvt Ltd provides enterprise business and mission critical products and solutions for all segments. The firm offers the full gamut of services, ranging from consultancy and outsourced product development to open source training.

MMFSL (Mahindra & Mahindra Financial Services Ltd) has adopted MFEKA (Mahindra Finance Enterprise Key Access), which is a structured approach to providing easy accessibility to all the applications. It focuses on business, customer, dealer and Intranet-based applications. Due to demanding needs, the complexity of portals and their technical and functional requirements have increased. Even though there are tools available to build simple portals, the challenge lies in integrating them. One such challenge is with authentication. In this competitive environment, it is imperative to have robust processes. To cope up with the ever growing number of users and to avoid technical complexities, MMFSL has always aspired for excellence in all its products, services and processes. **Unotech** as a vendor began its partnership with MMFSL in order to replace its existing mailing platform and was eventually selected to develop the EKA Core Engine.

The five major pillars on which EKA'S technology had to be designed are: sustainability, reliability, compliance, scalability and robustness in the technology used. The growing business of MMFSL brought along with it more complex rules, and the deployed solution had to be designed to sustain complex processes. The model preferred in such a case was to adopt a partner like **Unotech**, who offered enterprise-ready open source solutions as a service.

Unotech helps Mahindra & Mahindra Financial Services Limited to optimise 87 per cent of its proprietary field force solutions. **Unotech** has also been maintaining the servers and the core engine used for EKA, which has gained more than 1000 million hits since its inception. The solution, with its dynamic rule & role engine, which is a multi-level approval engine, has serviced a quarter of a million EKA requests for securing and fulfilling compliance needs. It is a single unified repository, resulting in great advantages to administrators when maintaining the systems.

In a fast-growing business, there are a lot of factors an organisation needs to deal with, and **Unotech** helped MMFSL in the following spheres.

Efficiency: By controlling critical points in production systems, like the authorisation channel and in record-keeping, vast improvements were seen in communication,

Suresh A Shanmugam is the National Head of Business Information Technology Solutions (BITS) of Mahindra & Mahindra Financial Services Limited

reduced data rejection, better employee training with consistent processes, easier access to data for quality decisions, improved relations with business users, streamlined administration and optimal trend analysis.

Customer satisfaction: It was imperative that customer satisfaction should increase with the process in place.

Unotech gave the most robust structure to the system, which made it more user friendly and one of the best-in-class communication systems.

Risk management: Having standardised procedures across the breadth of a company helped prevent errors. Accurate information flow was provided.

Traceability and due diligence:

In a growing business and market, the solution ensured maintenance of the complete set of records to guarantee the delivery of the right information and credentials, with full documentation to support it.

Improved user service delivery: A major impact was seen in providing services, with authentic data given via a secured path.

Improved TAT: Due to established processes, users could manage their own approval channels and appropriate communications, leading to accurate TAT governance.

Well established processes: Common processes for all digital approvals helped users to keep up with the solution, hence reducing the need for training.

Securing all requests: A four-layer and a multi-layer approval channel were established, which further eliminated the risks associated with insufficient documentation or vague assignment of responsibility/ownership.

Unotech Software Pvt Ltd also provides:

- Single sign-on solutions that can be integrated with proprietary and open source product lines.
- An Enterprise Document Management System as a product line and support services for other open source product lines.
- A mailing solution on open source platforms.
- Implementation and customisation of enterprise-ready open source products.
