

The screenshot shows the Grails application's 'User List' page. At the top, there's a 'Create User' button. Below it, a form is displayed with fields for 'Userid' (set to 0), 'Username' (set to 'Sahil'), and 'Password' (set to 'Helloworld'). A 'Create' button is at the bottom of the form.

Figure 6: Create User screenshot

```
mysql> select * from user;
+----+-----+-----+-----+-----+
| id | version | password | userid | username |
+----+-----+-----+-----+-----+
| 1 | 0 | Helloworld | 0 | Sahil |
+----+-----+-----+-----+-----+
1 row in set (0.00 sec)

mysql>
```

Figure 7: MySQL query output

application rather than using the 'install-plugin' command.

5. *Keep your view simple:* Make your views as simple as possible.
6. *Use layouts:* Use a layout for a consistent look across your UI.
7. *DRY:* Keep your views DRY ('Don't repeat yourself').

Split the repeated content into templates.

8. *Automate the process:* Write scripts to automate any repetitive tasks. This will reduce errors and improve overall productivity.
9. *The location convention:* Services go into the *Services* folder. Controllers go into the *Controller* folder.
10. *The naming convention:* All models, services, controllers and scripts should be named consistently. In our example application, we had a model named 'User'; hence, our controller was named 'UserController'. Grails will link them based on the naming convention.

With Grails, we can develop applications quickly and in an agile manner. Since it is based on well tested paradigms like 'Convention over configuration' and DRY, Grails provides a robust platform for development. In a world where developers race against the clock to meet vicious deadlines, having a framework which provides so many built-in features makes Grails an invaluable tool.
