

YOU SAID IT

Contributing content

I started using CentOS 7 as my primary OS, thanks to the previous issue of OSFY in which you shipped the CentOS 7 DVD. I was able to tweak it to my liking, the details of which I have included in my blog: priteshugrskar.wordpress.com. Also, I have always wanted to try out GIT and was not able to set it up the first time I tried. This time though, it worked fine and I was wondering if you would be interested in publishing an article on installing and setting up GIT on CentOS 7, which I plan to write. Kindly let me know. Is there a way that my blog articles could be published in the magazine (online or offline versions)?

ED: Thank you for writing in to us. We are glad that our DVD could help you use CentOS 7. Thank you for including it in your blog too. We always welcome open source enthusiasts who want to contribute content to our magazine. In order to submit an article to us, you will have to first send us a detailed Table of Contents (ToC) and once it is reviewed by our team, you can go ahead with the write-up. You can find our editorial guidelines at <http://www.opensourceforu.com/write-for-linux-for-you/> for your reference. Please feel free to get back to us in case of any other queries; we're always happy to help!

Query regarding Linux kernel support for file systems

I read the August 2014 issue of OSFY. On Page 26 ('An Introduction to The Linux Kernel'), the last line reads, "The Linux kernel supports all major file systems including MS Windows' NTFS." Yes, it's true! But does the Linux kernel support the new ExFAT file systems? In my personal experience, it does not. I've a 64GB USB 2.0 pen drive (Transcend), and when I used it in Windows XP, I was unable to format it in FAT32 but could do so in NTFS, and NTFS alone. But, when I used the same pen drive in my sister's laptop which runs on Windows 7, I was able to format it in two versions - NTFS and ExFAT.

I've my own reasons to believe that ExFAT is a newer version file system. On my sister's laptop, the hard disk's second partition of 480GB was formatted in ExFAT too! After putting the photos into her hard drive, I formatted my 64GB pen drive in her laptop—in the ExFAT file system. I was able to access the pen drive on her laptop (running on MS Windows 7), but the pen drive was not accessible on both my desktop (running on MS Windows XP) and my laptop running on Ubuntu 13.10. The pen drive was actually detected only on the XP system, but was not accessible. A message came up saying that I must format it before I can use it. Please look into this new format too.

ED: Thank you for your query. We have forwarded your email to the author of that article and we are forwarding this request to the other authors who write for us in order to come out with a write-up featuring more information on the different file systems.

Setting up a proxy server

I am trying to open a small office and plan to use five computer systems. I would like to set up a proxy server to share the broadband connection in the office and also to restrict access to certain social media websites. How am I supposed to go about this? Kindly note that my financial resources are limited. An early reply would be very helpful.

ED: You can set up a Squid caching proxy server which will help you in achieving what you want. To configure it, you can refer to the link below:

<http://www.squid-cache.org/>

You can also install and use firewalls like IPCop and pfsense to share and restrict access to the Internet.
