

OpenMEAP

Create Mobile Apps with Ease!

OpenMEAP is an open source HTML5 mobile application platform. It empowers businesses and consumers with a little programming experience to create, manage, and deploy mobile applications that can then be easily optimized for various devices such as tablets, desktops, and smartphones.

Let's understand the term MEAP before going into further explanations on OpenMEAP. A mobile enterprise application platform (MEAP) is a wide-ranging suite of products and services that enable the development of mobile applications across various platforms. The term MEAP was coined in a 2008 Gartner Magic Quadrant report, which is a series of market research reports published by Gartner Inc frequently.

MEAPs address the difficulties of developing mobile software by managing the user groups, as well as the range of devices and networks at the time of deployment and throughout the mobile solution's lifecycle. Unlike individual apps, a MEAP provides a widespread, long-term approach to deploying mobility. Cross-platform considerations are one of the main reasons for using MEAPs. Let us consider an example in which an organisation uses a MEAP to develop the mobile application and deploy it to a variety of mobile devices such as smartphones, tablets and notebooks with no changes to the underlying business logic.

The MEAP approach is encouraged because organisations need the following mobile solutions:

- Support for multiple mobile applications
- Support for multiple mobile operating systems (OS)
- Integration with multiple back-end data sources

OpenMEAP is an open source HTML5 mobile application platform, which enables clients to easily create, manage and install mobile applications that are automatically optimised for almost every device. Organisations gain considerable savings and advantages by using this flexible platform.

OpenMEAP is compatible with the Android, iOS and BlackBerry platforms. Currently, it is available only in English. It delivers productivity benefits like mobile data access while maintaining a good amount of security and Public Key Infrastructure compliance. It enables organisations of all sizes to proficiently develop, deliver and manage mobile applications while using their existing Web development platform and resources. It provides flexibility to write the application in a preferred Web development environment
