

it gives you optimum performance. Even if we offer a quad-core device, the battery consumed will still last for 18-24 hours. The display is such that it doesn't eat up the battery's charge. It doesn't break easily. So it is not just about spec-to-spec comparisons, it is the whole package of what the device really offers in terms of the software and hardware combination. Our build quality speaks for itself, and I would like to say that people were pleasantly shocked to see the build quality that we offered in Moto E at such an affordable price. We believe that consumers deserve good products and that is why we build them.

Q Since you bank on the Stock Android experience, do developers have some part to play in building these devices? We have a large engineering team in India, the largest outside the U.S. Our team of developers in India is responsible for an essential part of the devices that come out from our stable. And we are constantly looking at opportunities to leverage the fabulous engineering talent that India has to offer.

Q Xiaomi has also received a great response in the Indian market and is following the same online selling model as you did. How do you plan to counter such situations? As I said, as long as we keep on providing the best possible devices and value, and make sure that we take care of our consumers, we know that we will continue to get the same acceptance that we received in the last six months. Our success story bears testimony to the fact that it is the best way to go; so we will continue on the same path.

Q When Android was first introduced, people liked it for many reasons. Apart from an ecosystem for free apps, Android became a reason for many to step into the smartphone domain. Have the reasons people look at Android changed over time? I think the Android ecosystem has matured considerably over a period of time. A lot of developers have realised that there are more monetisation opportunities than just directly pricing the app. The ecosystem has matured so much that the interactions, which two years back were very app-centric, have become very app-network-centric. People now play games with their friends, through the apps. So, the ecosystem has evolved in a wonderful way, paving the way for a lot more opportunities for developers and connecting users. If I want to play chess, I can play a standalone game or I can play with my friends. So interactivity between apps and between people has increased due to this ecosystem. Android has been ruling this space and will continue to do so in the future as well.

Q What is your opinion about the Android One platform? It is a great initiative from Google. I will not be able to disclose whether or not we will adopt that platform, but I can say that in a way, Moto E was the benchmark for a lot of things done today. **END**
