

DVD OF THE MONTH

A great Live operating system to try your hands on.

KNOPPIX 7.4

Knoppix 7.4 is a Debian-based operating system that comes with LXDE as the standard desktop, LibreOffice, Firefox, GNU Image Manipulation Program (GIMP) and many more ready-to-use applications. It also has tools for data rescue, network analysis and system repair.

The latest release features the integration of *systemd*, the start and service manager. This bootable Live system on the DVD can be used as a productive Linux system for the desktop, as an educational system or as a rescue system. This DVD can automatically detect a wide range of hardware, and has support for many graphics cards, sound cards, SCSI and USB devices as well as other peripherals.

The minimum system required to try this distro is:

- Intel/AMD-compatible CPU (i486 and above),
- RAM: At least 256MB for the graphical desktop. Recommended for working with various office applications: 1GB RAM,
- A bootable DVD drive (IDE/ATAPI/SATA, Firewire, USB),
- A standard VGA-compatible graphics chipset,
- PS/2 or USB mouse.

You can refer to the Knoppix Cheatscodes available on the DVD for localisation support (language, keyboard), expert options and workarounds for problematic hardware.
