

An A-Z listing of Network Security Solutions Providers

Cisco Systems | Bengaluru, India

The company has an end-to-end portfolio of security solutions that can be customised as per an organisation's requirements. The solutions provide a seamless integrated experience for the end user. The company offers a range of solutions based on Adaptive Security Appliances (ASA) firewalls, ASA CX next-gen firewalls, the Identity Services Engine (ISE), and Intrusion Prevention Systems (IPS). Its approach towards network security involves offering a combination of both software and hardware solutions to customers. The Cisco ASA firewall solutions enable businesses to meet all their security needs with Cisco's multi-scale performance and comprehensive suite of highly integrated, context-aware security services.

- The Cisco context-aware (CX) firewall goes beyond the typical next-gen firewalls, which are technically capable of recognising only a portion of the context of a flow and are ineffective against emerging threats.
- The Identity Services Engine (ISE) is a core component of the Cisco TrustSec solution and Cisco SecureX architecture, essential for network security and is ideal for implementing BYOD.
- Cisco IOS Intrusion Prevention System (IPS) provides the organisation's network with the intelligence to accurately identify, classify, and stop or block malicious traffic in real time.

The company also offers integrated router or switch security, and integrated threat control solutions to enterprises for network security. Some of Cisco's network security products include: Router Security, the Small Business SA500 Series Security Appliances, Cisco Automated IOS Protection Solution and Cisco IOS Content Filtering.

Leading clients: The company is the leading network security vendor in India, according to data shared by Frost & Sullivan for (CY Q2 2012). The company also sees significant traction from traditional enterprises, as well as the retail, health and education verticals, as organisations in these domains realise the importance of securing their data against internal and external threats.

Major open source offerings: Cisco is a formidable player in the network security space and has a host of end-to-end solutions that aim at safeguarding organisations. In 2007, Cisco acquired IronPort and, since then, has contributed to the open source community, offering bug fixes, feature patches, funding for developers and for core projects.

Cisco has also won recognition from the community for its Apache Spam Assassin solution, which is used for email-spam filtering.

USP: The company's network security solutions are based on the Borderless Network approach that was founded on Cisco's best-in-class wireless networking and security solutions. Using the network as the platform, businesses can use integrated network security products, standalone appliances, fully hosted or hybrid-hosted offerings, or security SaaS to build a wide range of security solutions. To gain the greatest value for their security investments, Cisco builds ecosystem partnerships and offers professional services, thus creating one of the most complete offerings in the marketplace. Cisco's solutions are based on the Borderless Network Architecture, allowing employees and their organisations to connect and communicate anytime, anywhere and on any device—in a secure and reliable manner.

Special mention: Cisco recently won an award for network security appliances at the CRN Annual Report Card Awards, held on August 21, 2012 at the XChange 2012 conference in Dallas, Texas.
