

The architecture of the N300-X enables businesses to access applications and services safely and securely from the Nevaless Cloud. The solution is ISP-agnostic and is compatible with all current and future Internet services.

Major open source-based offerings: Nevaless Networks provides SNORT for intrusion prevention and ClamAV as an open source alternative to the commercial Trend Micro, the gateway anti-virus solution.

Leading clients: Shaman Motors, Empire Hotels, M.S. Engineering College, Fredun Pharmaceuticals, and more.

USP: The company offers services like reduced costs and no hidden expenses, no CAPEX, no licensing and maintenance hassles, the 'pay as you go' service model, a simple-to-use single security solution, remote manageability and administration from anywhere, improved administration of resources, latest security updates, upgrades and automated monitoring, localised free telephone and online support, etc.

Special mention: Featured in 'NASSCOM's Emerge 50 start-ups for 2011' list and was one among Techcircle's 'Top 10 Emerging Indian SaaS Companies for 2012'.

Payatu Technologies | Pune, India

The company offers a variety of security services including security assessments, managed security services, consulting and training. Payatu delivers high-end services focusing on organisations' actual needs when securing themselves and their assets. The security assessments are based on Payatu's own threat modelling methodology called the BRT model that defines the 'Business, Risk and Threats' for an organisation. The prime services offered include:

- Product security testing including software and hardware.
- Application security assessment including client, server, desktop and mobile applications.
- Infrastructure security assessment including IP and telecom networks.
- High-end technical security training including Android systems security, Linux systems security, Web hacking and network hacking.

Apart from security services, Payatu also manages and organises Nullcon, India's largest security conference.

Major open source-based offerings: A firm believer in the power of open source, most of the company's security assessments and training are done using open source security software. Its dependence on and passion for open source is not limited to just using it, but the company is one of the few security organisations that has gone ahead and contributed to the open source community by writing open source security software and publishing it online for free. Some of its notable projects are 'Game Over'—a Web security learning platform, and 'Jugaad'—a framework to protect against malicious code injection in Linux processes.

Leading clients: The company has various clients across different verticals around the world, including banks, finance firms, government, telecom operators, healthcare providers, security software vendors, etc.

USP: Payatu's assessments are based on years of experience and research in software development issues. It applies its ingenious threat modelling technique—BRT—to cover the otherwise ignored aspects of the target in a conventional security assessment.

Special mention: The company's team of experts has responsibly disclosed security vulnerabilities to various large players such as LinkedIn, Apple, Cisco, etc., out of a passion for security research. The research team's dedication and motivation in finding flaws in anything and everything has vividly demonstrated Payatu's world-class expertise in the security domain.
