

Figure 1: Toggle switch

Select menus: The *select* menu is based on a native *select* element, with a custom-styled *select* button that matches the look and feel of the jQuery Mobile framework. It is keyboard-accessible on the desktop as well. When you click the button, the native OS menu will open, and after selecting the value when the menu closes, the custom button's text is updated to match the selected value. To add a select menu to your page, there should be a *select* element with a set of *option* elements. Similarly, you need to set the *for* attribute of the *label* tag to match the *id* of the *select* element, as we did earlier with the toggle switch.

There is no need to add the *data-role* attribute here; we can make a drop-down menu as easily as in simple HTML:

```
<label for="choice" class="select">Select your Country</label>
<select name="choice here" id="choice" >
  <option value="america">America</option>
  <option value="australia">Australia</option>
  <option value="brazil">Brazil</option>
  <option value="canada">Canada</option>
  <option value="denmark">Denmark</option>
  <option value="france">France</option>
  <option value="germany">Germany</option>
  <option value="india">India</option>
</select>
```

The result of the above code will look similar to what's shown in Figure 2.

In the above template, to group the list of countries under a list divider, you need to use the *optgroup* element, which will categorise the list accordingly:

```
<select name="choice here" id="choice" >
  <optgroup label="A">
    <option value="america">America</option>
    <option value="australia">Australia</option>
  </optgroup>
  <optgroup label="B">
    <option value="brazil">Brazil</option>
  </optgroup>
</select>
```

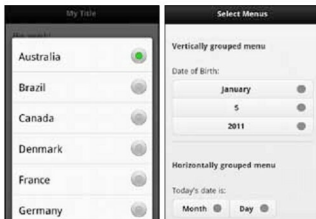

Figure 2: Select menu

Figure 3: Horizontal select menu

Vertically grouped select menus: For the grouped select input, add *data-role="controlgroup"* in the *<fieldset>* tag, and a *<legend>* tag, which will specify the label for the whole group:

```
<div data-role="fieldcontain">
  <fieldset data-role="controlgroup">
    <legend>Date of Birth:</legend> // this will signify
    label for whole group
    <label for="month">Month</label>
    <select name="select month" id="month">
      <option>Month</option>
      <option value="jan">January</option>
    <!-- etc. -->
    </select>
    <label for="day">Day</label>
    <select name="select day" id="day">
      <option>Day</option>
      <option value="1">1</option>
      <!-- etc. -->
    </select>
    <label for="year">Year</label>
    <select name="select year" id="year">
      <option>Year</option>
      <option value="2011">2011</option>
      <!-- etc. -->
    </select>
  </fieldset>
</div>
```

Horizontally grouped select menus:

```
<fieldset data-role="controlgroup" data-type="horizontal">
```

Use the above code, and you will be able to see a horizontal menu like what's shown in Figure 3.

Dialogue boxes: These are like pop-ups that appear over the previous screen; they need some user action or response—e.g., a *confirm* dialogue box asks the user a question and
