

Figure 7: Image pop-up

```

☐

```

Image pop-up: There are various jQuery Mobile plug-ins that can make your image gallery jaw-dropping, like Thickbox, Lightbox, Fancybox, Facebox, Slimbox, etc. Using these image pop-ups gives you a closer look at your picture. They are very simple to use; you just need to add the plug-in files. A demo for the Thickbox plug-in is given below; the rest are similar, so give them a try.

How to use a plug-in:

1. Download `thickbox.css` and `thickbox.js` from <http://thickbox.net/>.
2. Add the two files in the respective `<script>` and `<link>` tags.
3. Add `class="thickbox"` within your `<a href>` tag and add `<img>` tag under the parent `<a href>`.

In the head tag:

```

<link rel="stylesheet" href="thickbox.css" type="text/css"
media="screen" />
<script language="javascript" type="text/javascript"
src="thickbox.js"></script>

```

In the body tag:

```

<center>

```

```

<a href="android image.jpg" class="thickbox">
</a>
</center>

```

Note: In `<a href>`, specify the path of the image—i.e., `folder name/image.jpg`. A screenshot of the image pop-up is shown in Figure 7.

Tool-bars: A tool-bar is an important part of an application, and gives an idea about what type of content the page has. We call them header bars, footer bars or navigation bars. To include a simple header bar in your page requires the following single line of code:

```

<div data-role="header">
<h2>Title</h2></div>

```

Tool-bar with buttons: A tool-bar contains buttons with standard actions, with some pre-defined icons like delete, check, etc. To add this to your page, use the following commands:

```

<div data-role="header">
<a href="index.html" data-role="button" data-
icon="delete">Cancel</a>
<h1>Edit Contact</h1>
<a href="index.html" data-role="button" data-
icon="check">Save</a>
</div>

```

Footer bars: Footer bars can be added in the same way you add the header, with `<div data-role="footer">`.

To add padding between the buttons, add `class="ui-bar"` in the div tag. To group buttons together into a button set, wrap the links in a wrapper with `data-role="controlgroup"` and `data-type="horizontal"` attributes:

```

<div data-role="controlgroup" data-type="horizontal">

```

Nav-bars: jQuery Mobile has a very basic navigation bar widget, in which up to five buttons can be provided, with optional icons. To include a very simple nav-bar with two buttons, use the following commands:

```

<div data-role="nav-bar">
<ul><li><a href="a.html">Page One</a></li>
<li><a href="b.html">Page Two</a></li>
</ul></div>

```

Whenever you click the nav-bar, it will get activated. If you want to set the item in active state, use `class="ui-bb-active"`. To restore the active item each time the page is rendered, use `class="ui-state-persist"`. You can also use both the classes together in the following way:
