

Figure 9: Tool-bar themes

page. To set a transition effect, add `data-transition="flip"` (or instead of `flip`, add `slide`, `pop`, etc):

```
<div><a href="test.html" data-transition="flip"><button name="b1" value="Click Me"></button></a></div>.
```

To learn how various transition effects can beautify your app, try the effects demos at <http://jquerymobile.com/demos/1.0a4.1/docs/pages/docs-transitions.html>.

Note: Many Web browsers and mobile devices don't support this feature yet; Google Chrome does, so use it if your browser doesn't show any transitions.

Get started with themes

Theming is the way to display the same content in different styles, formats and colours to give your application a different look across all the pages in your application. jQuery Mobile provides various very easy-to-use themes. Let's dive in!

Playing around with theme swatches: JQM has a healthy theming framework, called a *swatch*, which supports 26 sets of tool-bars, buttons, colours and content. To give your application a specific theme, you just need to add the `data-theme` attribute, which can be applied to any widget—or if applied to a page, then all widgets will automatically inherit the theme. The framework provides five default theme swatches that are assigned letters *a*, *b*, *c*, *d*, *e*... For example:

```
<a href="#" data-role="button" data-theme="a">Button</a>
```

Theming tool-bars: To set the header or footer bars to a different colour theme, use the `data-theme` attribute with `data-role="header/footer"`. Buttons in tool-bars can also use the same themes with this same attribute.

Using distinct themes in a tool-bar: You can provide different themes to the tool-bar and to the widgets (buttons) in the tool-bar:

```
<h4>Different themes in a header </h4>
<div data-role="header" data-theme="a">
```

```
<a href="index.html" data-role="button" data-icon="delete"
data-theme="c">Cancel</a>
<h1>Edit Contact</h1>
<a href="index.html" data-role="button" data-icon="check"
data-theme="b">Save</a>
</div>
```

Theming content: The following code will theme the whole content of the page, and will colour the background of the page accordingly:

```
<div data-role="page" data-theme="a" data-content-theme="a">
```

Collapsible blocks: The following code will create a collapsible content block, which will only be shown on clicking the collapsible button:

```
<div data-role="collapsible" data-collapsed="true" data-theme="b">
<h4>Different themes in a header </h4>
<div data-role="header" data-theme="e">
<a href="index.html" data-role="button" data-icon="delete"
data-theme="c">Cancel</a>
<h1>Edit Contact</h1>
<a href="index.html" data-role="button" data-icon="check"
data-theme="b">Save</a>
</div></div>
```

Theming forms: You can implement themes with forms in a similar manner; use the `data-theme` attribute in the page containing the form elements to make all elements inherit the theme.

Theming lists: List-views can be themed in the following way:

```
<ul data-role="listview" data-inset="true" data-theme="b" data-
filter="true">
<li><a href="#">Agriculture</a></li>
<li><a href="#">Animal</a></li>
<li><a href="#">Astronomy</a></li>
<li><a href="#">Building</a></li>
<li><a href="#">Business</a></li>
</ul>
```

I have covered many important aspects of jQuery Mobile. This framework is the best thing I have come across. It has completely changed my views on the mobile UI. Many more features like page loading and widgets are still to be explored; you can Google and get familiar with them. You will love them. Suggestions and queries are always welcome.
