

with *View Hello World* permission views a specific page, a *helloworld* string will be printed a specific number of times (the number is taken from the *messages.properties* file and is equal to the global properties).

Now edit the *config* file at: *helloworld/omod/src/main/resources/config.xml* and add the following *privilege* under the *privilege* tag:

```
<privilege>
  <name>View Hello World Phrase</name>
  <description>Able to view the "Hello World" greeting</description>
</privilege>
```

Then, add the global property—the number of times to print *helloworld*—in *messages.properties*:

```
<globalProperty>
  <property>helloworld.repeatNumber</property>
  <defaultValue>3</defaultValue>
  <description>Number of repetitions of the phrase "Hello World"</description>
</globalProperty>
```

After this, create *viewHelloWorld* in *helloworld/omod/src/main/webapp* with the following commands:

```
<% include file="/WEB-INF/template/include.jsp" %>
<openmrs:require privilege="View Hello World" otherwise="/login.htm" redirect="/module/helloworld/viewHelloWorld.htm" />
<% include file="/WEB-INF/template/header.jsp" %>
<br/>
<openmrs:globalProperty key="helloworld.repeatNumber" var="repeatNum" />
<c:forEach begin="1" end="${repeatNum}">
  <spring:message code="helloworld.helloWorld"/> <br/>
</c:forEach>
<br/>
<% include file="/WEB-INF/template/footer.jsp" %>
```

You can access this page at the following location after module installation:

```
<Web address of the OpenMRS installation> /module/helloworld/viewHelloWorld.htm
```

Adding to the user dashboard

In order to make it visible to users in their homepage after logging in (i.e., on the dashboard), add the following to *<API>helloworld/omod/src/main/resources/config.xml*. *AdminList* is a class that provides functionality to extend the dashboard view when module developers want to add content to it. Like this, there are other extension points also, which

let one add content to specific parts of the screen, whenever required by the module developer:

```
<extension>
  <point>org.openmrs.admin.list</point>
  <class>org.openmrs.module.helloworld.extension.html.AdminList</class>
</extension>
```

Once this is done, it's time to edit *AdminList.java* to add content to it. This needs to be added to the *admin.list* extension point. The following should be the content of the *admin.list* file:

```
package org.openmrs.module.helloworld.extension.html;

import java.util.HashMap;
import java.util.Map;
import org.openmrs.module.Extension;
import org.openmrs.module.web.extension.AdministrationSectionExt;

public class AdminList extends AdministrationSectionExt {
  public Extension.MEDIA_TYPE getMediaType() {
    return Extension.MEDIA_TYPE.html;
  }
  public String getTitle() {
    return "helloworld.title";
  }
}
```
