

```
public Map<String, String> getLinks() {
    Map<String, String> map = new HashMap<String, String>();
    map.put("module/helloworld/viewHelloWorld.htm",
        "helloworld.view");
    return map;
}
map.put("module/helloworld/viewHelloWorld.htm", "helloworld.view");
```

In the above code snippet, *helloworld.view* will be taken from the *messages.properties* file.

Mapping the *messages.properties* file

Here, the following messages are used, which need to be added to the *messages.properties* file, so that they are converted to the correct string:

```
helloworld.title=Hello World Module
helloworld.helloWorld=Hello World!
helloworld.view=View Hello World
```

Now compile the module API code by clicking the *Clean and Build* option.

Once that's completed, compile the Web part of the OpenMRS module, to get the *omod* file, as shown in Figure 1.

Now, go to the target directory to get the *OMOD* file that is created.

You can now log into the OpenMRS installation, go to the *Administration* tab, click on *Modules*, and then click on *Manage Modules*. Upload the module on this page and start it. Your module is now ready for use, and can be reached from the *Admin* dashboard.

Hope you enjoyed creating an OpenMRS module.
