Sarfaraz Alam:

Can anybody help me how can I download team-viewer? If anybody has any link then please send me link for the6?

Like · comment

Thiagarajan Varadharaj: You can use "showmypc" for an alternative. Try out.

Mankala ShravanKumar:

I bought Lenovo G580 laptop and installed Ubuntu 12.04. Wired connection is not working. Can someone help me?

Like · comment

Muziwakhe Mzk Nhlapo: Is your wireless working?

Dux Brandon: MZK guru

Mankala ShravanKumar: Wireless working but wired connection not working.

Magimai Prakash:

Hi, usually, I can use internet from my mobile using PC suites in Windows. In Linux, is there any solution for using internet via mobile?

Like · comment

Praveen JR Mohadeb: Just connect the phone just like you do in Windows, go to the network and set up a new mobile broadband connection. You don't need to install any software as it works out of the box in Linux.

Vamsi Indana:

How can I upgrade to Ubuntu 12.04 64 bit from 32 bit?

Like · comment

Raghava Karthik Reddy: Get a 64 bit computer!

Aboobacker Mk: Sorry, it is impossible.

Vamsi Indana: In 64 bit system only, I installed Ubuntu 12.04 32 bit, now I need to upgrade to 64 bit.

Vineesh Valsalan: In any case it is not possible. Backup your files, and re install 64 bit OS.

Daniel Ribeiro:

I need help. I have a multi-boot Samsung Netbook with Mint Xfce, Xubuntu and Windows. I can't change brightness of the monitor in the Linux distros. I'm only able to change brightness when I boot it with Windows. Please help me.

Like · comment

Raghava Karthik Reddy: Change bios settings to default. Use this commands in your terminal! 'xbacklight'-Press three times to increase the brightness. 'xbacklight' -set 50"-to set half-brightness! I hope this works for you!

Daniel Ribeiro: Thanx!

Gerald Hickman:

I need some help. I have a Samsung np305e5a running multiple boot; Windows (which will not boot), chakra and Ubuntu. Everything was working fine until I added some home-school programs and my WiFi quit working. I've run some commands given me through others and apparently the WiFi address is no longer assigned and I have no idea how to assign it. Any help is greatly appreciated.

Like · comment

Workhorse Black: Putting the code to wireless router in this should help. It gives the computer information that runs your WiFi.

Gerald Hickman: Thanks but I'm talking about assignment inside the computer itself.

Tushar B Kute:

I want to install software in Ubuntu from 'Software Centre'. I get search results for a particular software but none of the software shows "Install" button in front of it. Instead, it shows button "Get the source". What kind of problem is this?

Like · comment

Raghava Karthik Reddy: It's not a problem! Some softwares are only available in source format! Users can modify it and use it for their particular requirement! For example, if a software can do two capabilities, users can omit an unwanted part and include the useful part! It provides more flexibility to the user!
