The Open webOS is now ready to be ported to new devices as confirmed by chief architect, Steve Winston. The source code for Open webOS is available on the project's Github repository. The developers are further planning to upgrade the web-technology-based foundations of Open webOS, updating to Qt5, WebKit2, the BlueZ Bluetooth stack and the ConnMan network manager. HP is also looking forward to an improved rendering architecture for the Luna systems manager. Open webOS cannot be run on old webOS devices, as they are not compatible with Linux kernel version 3.3 and also require various proprietary drivers.

**Here's a contest to rename JBoss**

Red Hat, the world's leading open source solutions provider, is on a mission to rename its JBoss Application Server (JBossAS). The company believes that JBoss has expanded its horizons and evolved beyond Java. To reflect this, Red Hat has launched a contest to rename JBoss to something that fits the bill.

In a blog post, Red Hat senior director, Middleware Engineering, Mark Little, explained that JBossAS is a very different project from what it had been when it was launched as an open source Java EE application server. Because the Java Virtual Machine (JVM) has also evolved, today the JBoss platform supports a number of other languages in addition to Java, such as Clojure, Ruby, Scala, and Red Hat's own Ceylon. Red Hat believes JBoss allows customers to choose any of these languages they want, in what it calls a 'polyglot' approach.

What's more, JBoss also supports a number of popular frameworks that are often deployed as alternatives to the traditional Java EE, such as the Spring Framework – making the 'J' in JBoss seem increasingly outdated.

Qualcomm to bring Java 2 ME to its chips

Qualcomm has disclosed plans to tie-up with Oracle to bring Java Mobile Edition (ME) Embedded 3.2 support to its QSC6270 Turbo chipset for machine-to-machine (M2M) applications.

Qualcomm said support for Java on its QSC6270 chipset will enable developers to make use of the firm's Gobi 3G modem. The system-on-chip (SoC) design, on the other hand, will be helpful in reducing costs as external chips are not required, according to a report.

Kanwalinder Singh, SVP of business development at Qualcomm, explained: "Qualcomm recognises the important role that the application environment and its developer ecosystem will play in helping grow and realise the potential of the emerging M2M applications. Collaborating with Oracle to enable Java on the QSC6270-Turbo chipset provides participants in the M2M ecosystem with a broad set of powerful technologies to fulfil key M2M requirements. This is a starting point as we will continue to
