

look for ways to deliver platforms that address the evolving needs of the growing M2M space."

The move is likely to help the company to get Java developers to choose its chipset over others. However, there is no information on exactly when Java ME Embedded 3.2 would be ready for production on Qualcomm's chips.

Here's an online open source store for you

myOpenSourceStore.com has announced the launch of its e-commerce store, which will be a first-of-its-kind online open source store to accelerate the adoption of OSS. The online store exclusively specialises in offering the best available OSS under a wide range of categories. Apart from that, it also showcases a detailed overview (with recommendations) of top rated products available for download, absolutely free.

The portal claims to have clearly identified, filtered and categorised the specific needs of each shopper in order to ensure a collaborative shopping experience that makes it easy for customers to navigate and find the right information and ensure the best selection of OSS.

Commenting on the launch of the portal, Devasia Kurian, managing director, myOpenSourceStore.com, said, "The slow adoption of open source in enterprises is due to the lack of a comprehensive ecosystem comprising of product selection, and support for installation and maintenance. With the launch of an engaging platform like myOpenSourceStore, the adoption of open source technology will accelerate, leading to the easy and inexpensive building of intelligent enterprises."

The company aims to bridge the gap by bringing open source closer to users who can efficiently increase business growth and reduce costs. The portal would primarily act as a catalyst for the increased consideration and non-intrusive adoption of OSS, he added.

The portal will be adding and displaying the best selection of OSS, making it convenient for customers to select and download. To make the installation experience seamless, the portal is also backed by a strong open source expert community, comprising of open source committers located around the globe.

You can run Linux on almost all Windows 8 PCs

The solution is finally out—thanks to the Linux Foundation. Previously, we reported that Microsoft had incorporated a Secure Boot technology in the Unified Extensible Firmware Interface (UEFI), which prevented users from installing Linux on Windows 8 PCs. Now, the Linux Foundation has come up with a solution to enable users to install an open source operating system in computers that ship with Windows 8.

The solution from the Linux Foundation will allow users to install most of the open source OSs in computers with Secure Boot enabled. It will pick up a licence key from Microsoft and then sign a pre-bootloader tool, which in turn will allow users to chain-load additional software without running another signature check.

Microsoft's plans for introducing Secure Boot in Windows 8 did not go down too well with the Linux community. Installation of Ubuntu, Debian, Fedora, or other OSs on Windows computers was easy, but Microsoft made things difficult in Windows 8 by including the UEFI instead of a traditional BIOS. The Secure Boot technology acts like a gatekeeper. It only allows the booting of an operating system with a security key. So, no gate pass meant, no entry! Secure Boot has the advantage of preventing viruses or other malware from infecting your PC while it boots. But the problem is that with such a strict security feature, unsigned software, like a program to install a Linux-based OS, will be blocked too.
