

Figure 1: Fedena main screen

see the login screen—log in with the username *admin* and password *admin123*. You'll see the main screen (Figure 1) with modules like *Admission*, *Examinations*, *Attendance*, and more. All functionality has been categorised into modules, and you can perform your desired operation with just a few clicks.

Fedena comes in both free and commercial versions; obviously, the commercial version has more features. The Fedena website has a link to a demo Fedena site where you can try it out before installing it locally. Here, you'll find three additional modules (*Hostel*, *Library* and *Transport*) that are only in the paid-for version (see Figure 2).

Fedena is highly customisable to your needs, with its plug-in friendly architecture. You can install various plug-ins to extend its functionality, and you can also write your own plug-ins. You can also integrate it with Moodle, another good open source learning management tool, and BigBlueButton, an open source video conferencing solution. Fedena is so feature-rich that I suggest you have a look at its complete features at the site—bet you'll be impressed.

Fedena can dramatically reduce the time and effort required to maintain a school. It is used by the Education Department of the Government of Kerala to automate about 15,000 schools in the state, and I am sure that what Fedena can do for those 15,000 schools, it can also do for you. So grab this cool tool, test-deploy it, and feel the power of open source.

What I like most about Fedena is that it has been developed by an Indian firm. Recently, I read an article stating that India contributes very little to the open source community in comparison to what it consumes. Products like Fedena show that we can develop some high-quality open source products, and also that the future of open source is quite bright in our country. With more and more developers joining the open source movement, we can surely turn into big contributors to the open source ecosystem.
