

Figure 1: Dashboard

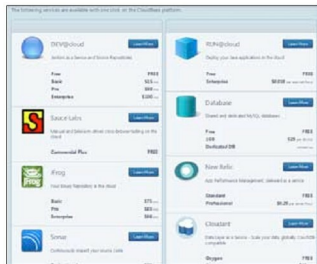

Figure 2: CloudBees services

define the database as a *resource-ref* in the app's *web.xml* file, bind it to your database as a resource in the *cloudbees-web.xml* file, and include the standard JDBC connection settings to connect to the database.

In *Subscribed Services*, click *Database*, then *Add New Database*; it will open the *Create a MySQL Database* dialog box. Enter a database name, user name and password. Once the database is ready, you can view its type, status, size, server, port, schema name, username and data source configuration tips on the dashboard. Users can create snapshots of the database, and also restore data as per their needs. Snapshot versions are also maintained (*Rollback to Snapshot* support) as seen in Figure 5.

CloudBees Eclipse plug-in (Run@Local, Run@Cloud)

Install the CloudBees Eclipse plug-in from <http://cloudbees.eclipse.com/> (SubEclipse needs to be installed). Validate your CloudBees account in Eclipse: via *Windows > Preferences*, select *CloudBees* from the left sidebar and click *OK*. Once validation is successful, it will try to synchronise the forge repository. Open the CloudBees Perspective (*Windows > Open Perspective > CloudBees*) as seen in Figure 6.

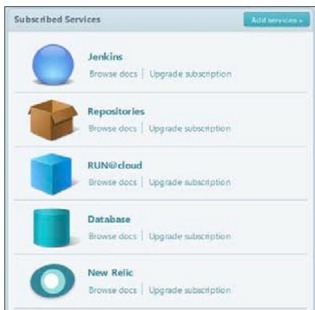

Figure 3: Subscribed services

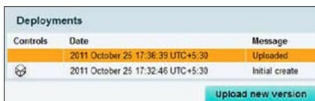

Figure 4: Deployments

Create a new repository: in the CloudBees dashboard, click the *Services* menu > *Repositories* > *Create new Code Repository*. Give the *Name*, *Permission Scheme*, *Repository Type* (Subversion, CVS, etc) and description. You can provide email IDs for email notifications for repository actions (commit or push notifications in HTML format).

Create a new CloudBees Project in the Eclipse CloudBees perspective. Give the *Project Name* and click *Next*. Provide a Jenkins instance (repository); and select the newly created repository. If it gives an error, enable hosting in Forge to configure the Jenkins job SCM automatically. If the SVN repository is not configured in Eclipse (go to *Windows > Preferences > Verify* to check if SVN is available), install SVN 1.8, select *SVNKit*, and restart Eclipse. Install Forge GIT integration and Forge SVN Integration (Subclipse, Subversive). Again use *Windows > Preferences > Verify* to check that SVN is available; then again select the Jenkins instance and SVN Forge repository. A simple project will be created with a single servlet. Enter a simple print statement in the servlet to check when it is running.

To deploy the app, right-click the CloudBees project, and select *Run as > CloudBees Application (local)*. If you're asked to unblock the program, do so. Access <http://localhost:8335/> to check local running.
