

KNOW HOW?

QA & SECTION

Q I recently installed openSUSE 11.4 (GNOME) on my system and was trying to install Google Chrome browser on it. I have downloaded the RPM package manager for 32-bit openSUSE. Now, when I try to install the RPM by running the following command, I get an error.

```
rpm -iUvh google-chrome-stable_current_1386.rpm
```

As soon as I run the command, it generates the following error message:

```
warning: google-chrome-stable_current_1386.rpm: Header V4 DSA/SHA1 Signature, key ID 7fac5991: NOKEY
```

```
error: Failed dependencies:
```

```
lsb >= 4.0 is needed by google-chrome-stable-15.0.874.106-107270.i386
```

```
libpng12.so.0 is needed by google-chrome-stable-15.0.874.106-107270.i386
```

Please suggest how can I resolve this issue?

—Neeraj Arora,
neerajarora.021@gmail.com

A. The error is due to failed dependencies. Google Chrome depends on 'lsb' and 'libpng12' libraries to work. So you need to install these two libraries first and then install Google Chrome.

To install the 'lsb' and 'libpng12' libraries, I would suggest that you use YaST. Go to 'Computer --> System --> YaST'. Provide the 'root' password and click 'Software --> Software Management'. Go to 'Find' and search for 'lsb' and 'libpng12'. Now, select the package and install it by clicking the 'Apply' button. After the installation is complete, exit YaST and try installing the Google Chrome RPM package by double clicking the RPM package or by running the command from the terminal. We are assuming that your system is connected to the Internet.

```
rpm -iUvh google-chrome-stable_current_1386.rpm
```

Hope this resolves your issue.

Q I am using Fedora on a virtual machine. I was trying to compile C code but was not able to do so due to some error. The error that I get is: "Command not recognised." Can you please help me in compiling the code?

—Syed Ashraf,
ashraf1390@gmail.com

The error is because you have not selected the group that includes GCC, the GNU C compiler, at the time of Fedora installation. You need to install this before trying to compile any C code. To install GCC,

run either.

```
# yum groupinstall "Development Tools"
```

or

```
#yum install gcc gcc-c++
```

After successful completion of the installation process, you can try compiling C code. It should work now.

Q I have installed openSUSE 11.4 on my laptop. The default installation comes with Firefox 4 beta. Now, I want to upgrade to version 7.0 or 8.0 of the browser. Please let me know if it is possible to upgrade to either of these new versions.

—Aditya Sahay,
aditya.sahayleo@gmail.com

You can upgrade to Firefox 7.0 or Firefox 8.0 by following the steps given below.

First, add the Mozilla repository (commonly called the 'repo'). To do so, open the terminal and log in as the root user. Now, run the following command:

```
#zypper ar -f http://download.opensuse.org/repositories/mozilla/openSUSE_11.4/mozilla
```

```
#zypper ref
```

Next, close the terminal and open YaST. In YaST, go to 'Software' and then 'Online Update'. Now, search for Firefox using the 'Find' command. Here you can see Firefox 7.0 and 8.0. Just select and upgrade.
