

IPCop

Guard Your Network

Part—2

A basic installation of IPCop provides minimum firewall functionality such as a proxy, compatibility with various Internet connections, port forwarding, IPSec VPN, etc. To convert it into a complete Unified Threat Management (UTM) box, various additional features are required, which are available as add-ons. In this article, we explore how to install four important add-ons.

Add-ons like Advanced Proxy, URL Filter, Update Accelerator and Calamaris are not officially part of the IPCop distro, yet provide excellent additional functions such as an advanced proxy that enables network-based access control and

authentication; URL filter is used to block unwanted websites with automatic categorized blacklist updates; OpenVPN server for Client to server VPN. The important details, features and download links of our four add-ons are summarised in Table 1.
