

Table 1: Features, versions and download links of various add-ons

Add-on	Current Version	Function, features and download link
Advanced Proxy	3.0.6	Provides various additional functions over and above the basic proxy: Seamless GUI integration for advanced Web proxy configuration. Local user authentication including group-based user management identity (RFC 1413) authentication. LDAP authentication including Active Directory, eDirectory and OpenLDAP. Windows authentication including native Windows domains and Samba. RADIUS authentication. Extended cache management. Web access control by IP and MAC addresses. Download throttling. Time-based access restrictions. Extensions to supervise Web access by classrooms. MIME type filters. Blocking of unauthorised browsers or client software. Automatic client configuration support (PAC and WPAD). Download from: http://advproxy.net/download.html
URL Filter	1.9.3	Blocks websites just by selecting the unwanted category. This module is available for both IPCop and SmoothWall. It is ready to use. Download, install and run it. Seamless GUI integration for configuration and log viewer. Very flexible, as blocked categories are not hard-coded. Custom block categories can be included. Works with all squidGuard-compatible blacklists. Gives automatic blacklist updates on a scheduled basis. Time, category and client-based constraints (IPcop only). No reboot required for installation/removal, nor during operation. Download from: http://www.urlfilter.net/download.html

Add-on	Current Version	Function, features and download link
Update Accelerator	2.1.3	Caches various operating system patches and antivirus updates. Increases download speed up to a factor of 1.500 for a 64kBit/s ISDN connection. Guaranteed delivery from local cache, even if the Web proxy cache has been cleared. The Update Accelerator cache can be transferred from one IPCop to another for offline pre-loading. Download from: http://update-accelerator.advproxy.net/download.html
Calamaris Report Generator	2.1.2	Generates the following: Categorised proxy reports. Summaries. Request methods (GET, HEAD, ...). Incoming requests (TCP and UDP). Outgoing requests. Requested first- and second-level domains. Protocol reports (http, gopher, ftp, ...). Requested content-types and file extensions. Also performs size-based distribution of objects. Performs in defined time ranges. Download from: http://calamaris.advproxy.net/download.html

Note: Advanced Proxy is a prerequisite for URL Filter and Update Accelerator.

The set-up assumes IPCop (green) IP as 192.168.51.1, the IPCop Web access port to be 445 and the IPCop SSH access port of 222, with SSH access enabled (*System – SSH Access* in the IPCop Web GUI). To copy add-on binaries, you need to use *SCP*, and for installation you need direct console access or SSH access from another system. Linux users can use the *scp* and *ssh* utilities. Windows users can download and install WinSCP (winscp.net/eng/download.php) and Putty (<http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html>) for these purposes. That done, download the various add-on binaries from the links in Table 1 to your desktop. Secure-copy
