Sum	40643	100.00	23995908	100.00	5	11.17

Figure 4: Sample proxy report

for banned clients'. This can be very helpful if all users need to access some websites.

Update Accelerator

Enable it at the bottom of *Services – Advanced Proxy* and go to *Services – Update Accelerator*. This requires only a few settings. Select *Enable Log*, *Enable Passive Mode* and *Lower CPU priority for downloads*. You may also define a maximum download rate.

This is very useful; it caches various large downloads like updates for antivirus and OS patches, etc. Repeat requests are supplied from local cache, saving bandwidth and increasing download speed tremendously. To clear cache, either manually delete individual files, or set it to automatically delete unused files, via the *Maintenance* button in *Services – Update Accelerator*.

Calamaris report generator

This add-on requires no configuration. Go to *Logs – Proxy*

Reports to access the report generator. Calamaris can generate reports based on parameters like Domain, Performance, Contents, Requester, etc. The time needed for report generation may vary based upon the CPU, hard disk and log size. Reports can be viewed on-screen or exported to text files (see Figures 3 and 4).

So folks, this adds four important add-ons to the vanilla IPCop. Watch this column for further details!
