

Caution: Download VLC Player only from VideoLAN official website

Users are advised to download VLC player directly from the official website. According to some reports, few fraud companies are abusing the source code of VLC player and distributing the software infected with malware.

VLC Player by VideoLAN is undoubtedly one of the best and most popular media players available on Windows, Mac and Linux systems. Being open source software, the source code of VLC player is available to everyone. These fraud companies tweak the source code and inject their own malware in the player and then make it available for download through various sources. Assuming it to be the legit version of the software, users actually receive the infected version, which either does not work or spreads malware on their computer systems.

What's causing more trouble is that these fraud companies have Google Adwords accounts, so that they can buy advertisements on the Internet and expand their reach. Many such companies have even registered 'official sounding' domains, which trick users to believe that they're actually downloading from the official website.

Ludovic Fauvet, the developer of VLC player, says that his organisation, being a non-profit, does not have enough money to sue these companies that are discrediting his work and also abusing the GPL.

Users are now recommended to download VLC player only from the official website, in order to be 100 per cent sure that they get only the authentic version of the software that works fine and does not contain any malware.

NTT Communications wins Red Hat Cloud Leadership Award

Red Hat recently awarded NTT Communications, the international and long-distance service arm of NTT, with its Cloud Leadership Award for innovation in cloud services as part of the Red Hat Cloud Provider Program and for its free offering of cloud services to aid in Japan's disaster recovery after the Great East Japan Disaster.

NTT Communications launched its Biz Hosting Basic cloud service and joined Red Hat's cloud ecosystem as a Red Hat Premier Certified Cloud Provider in April 2010. Since then, NTT Communications has used Red Hat Enterprise Virtualization as the foundational virtualisation layer for its Biz Hosting Basic and also offers Red Hat Enterprise Linux as a guest operating system on its cloud.

In April 2011, Red Hat announced that NTT Communications had expanded its use of Red Hat Enterprise Virtualization, including Kernel-based Virtual Machine (KVM) virtualisation technology, after its initial success with the solution that included performance, security and scalability benefits.

Rob Bearden joins Gluster's board of directors

Open source storage solutions provider, Gluster, recently announced that Rob Bearden has joined the company's board of directors. Throughout his 20-year career, Bearden made significant contributions to the open source community. He is currently president and chief operating officer of Hortonworks, a company focused on the adoption and maturation of the open source Apache Hadoop project.

Previously, he served as president and chief operating officer of SpringSource until its acquisition by VMware, as COO of JBOSS through its acquisition by RedHat, and as chairman of the board of Pentaho. Bearden will support Gluster's continued growth and will provide guidance to help further develop its open source community.

WordPress for WebOS released

The WordPress.org development team has released WordPress for WebOS, the project's first mobile application for WebOS devices that works with both WordPress.com and self-hosted WordPress blogs. Using the mobile application, users can easily post to, and edit, their WordPress blogs from a Web OS 3.0.0 or later device, such as the HP TouchPad tablet. The application is released under the GNU General Public License version 2.0 (GPLv2).
