

Samsung sells 3 million Galaxy S II phones in 55 days

Shattering the original Galaxy S phone's sales records, the Samsung Galaxy S II Android smartphone sold over three million units within the device's first 55 days of its launch. The smartphone has become the fastest selling handset in the history of the company. It is a lightweight, dual-core smartphone that combines a Super AMOLED Plus viewing experience with incredible performance, all on Android, according to the company.

The next-generation smartphone also includes exclusive access to Samsung's four new content and entertainment hubs, integrated to provide instant access to music, games, e-reading and social networking services. "This milestone reflects the continued strong support from our carrier partners around the world, who have chosen the Galaxy S II as their flagship Android device," said J K Shin, president and head, Mobile Communications Business, Samsung.

Skype launches app for Android phones

Skype has launched a new application for Android phones, which allows users to make free video calls to their Skype contacts, including those on Apple iPhones.

With the new Android Skype app, users will be able to make free one-to-one video calls between Android phones, iPhones, Mac computers, Microsoft Windows PCs and televisions. This app would initially support video calling on selected HTC and Sony Ericsson phones, with more to follow soon. Neil Stevens, product and marketing chief, Skype, said, "We are committed to bringing Skype video calling to as many platforms as possible."

goJTAG: A free test system for electronic components

Developed by the Tallinn and Ilmenau Universities of Technology (in Estonia and Germany, respectively) and electronics companies Göpel and Testonica, goJTAG is the first university-driven open source project aiming at providing a full package for a JTAG newcomer, including training material, slides and exercises.

The goJTAG test system consists of a combination of hardware and software, and is used to check that digital and analogue electronic components are free of errors. The software includes a simulation component that fully illustrates the underlying concept of JTAG/Boundary Scan. You can now download the source code for the software from the website, for free.
