

Figure 3: A default App Engine project Directory Structure

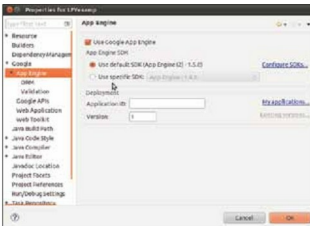

Figure 4: App Engine project settings

Figure 5: Deploying an App Engine application

```
web-app xmlns="http://appengine.google.com/ns/1.0">
<application>LFYexamp</application> <version>1</version>
...
other possible elements
...
</appengine-web-app>
```

You can verify these settings by going to the App

Engine setting under the Google context menu, which should show you a screen like that in Figure 4. This application can now be easily deployed by clicking the *Deploy* button, followed by a *Deploy* screen (Figure 5). After this, your application can easily be found online, at an address such as <http://lfyexample.appspot.com>.

So, without going into the details about application development, I have briefly covered how we can work with the platform, and get it started and installed on Eclipse.
