

than just a modern convenience, they are a necessity for what the future holds. Older browsers just don't have the chops to provide you with the same high-quality experience."

Dnshosting.it selects Red Hat Enterprise Virtualization

Dnshosting.it, the advanced Internet solutions developer located in Italy, has migrated its Cloud Server offering from VMware to Red Hat Enterprise Virtualization in order to remain competitive in the Italian market and gain the advantages of Kernel-based Virtual Machine (KVM) virtualisation technology, Red Hat recently announced.

Dnshosting.it offers domain registration, shared hosting, dedicated servers and services. With Red Hat Enterprise Virtualization as its foundation, the company has now also added cloud server and cloud data centre services to its offerings, establishing the company as a leader in the Italian cloud server market. In particular, its Cloud Server offering delivers more flexibility, enabling the activation of 256 MB RAM and 10 GB disk instance and a further increase of up to 16 GB RAM and 1024 GB disk on-demand in just a few minutes.

Developers get free Galaxy S II phones

Samsung is handing out free phones to the developer community. Yes, you read it right! Atinm, the developer responsible for maintaining CyanogenMod on the Samsung Vibrant and Captivate, recently got a free Galaxy S II to use to create a CM7 build for the smartphone.

Apparently, the company sent the phone to a select number of developers to encourage the practice of placing custom ROMs on its flagship device. "This doesn't mean Samsung will do this with every device; remember carriers have a big say in how locked down they want their devices to be, but it's great to see these first few positive steps from one of the world's largest Android manufacturers," mentions an Android Central report.

Beware of genuine-looking 'Firefox Security Alert'

IT security and data protection firm, Sophos, is warning people to be vigilant, following the discovery of an advanced 'scareware' campaign that presents users of Firefox with fake warnings that are designed to scare them into believing their computer is infected. Mozilla Firefox

users may see a genuine-looking 'Firefox security alert', which displays a convincing system scan, including a progress bar and the names of malware supposedly found in files on the victim's machine - all lending to the credibility of the attack as a way to frighten computer users into parting with cash to clean up non-existent malware infections.

The Document Foundation appoints advisory board

The Document

Foundation has appointed the first members of its advisory board, who will serve for an initial term of one year. The board will provide advice, guidance and proposals to the future board of directors and also consult on the development of the Foundation and its projects.

LibreOffice
The Document Foundation

The companies named are Google, SUSE, Red Hat, Freies Office Deutschland e.V., Software in the Public Interest, and the Free Software Foundation. "We're very proud, and warmly welcome the first members of the advisory board. Its composition shows that LibreOffice is a vendor-neutral, truly-free office suite, and confirms that the Document Foundation has created a solid base to build upon, for the community, for corporations and enterprises, and for adopters and end-users," said Florian Effenberger on behalf of the Document Foundation's Steering Committee.

Google discontinues specialised Linux, BSD search pages

Google has discontinued its specialised Linux and BSD search pages—earlier available at google.com/linux and google.com/bbsd. Now, users are redirected to google.com/webhp, a standard search page.

A Google spokesperson confirmed the news, saying: "These services were established many years ago to offer search across a limited index of the Web, which in the past was a better way to find this information. Today, search quality has advanced tremendously, and based on our analysis, we've found that in most cases, you're better off looking for this kind of specialised information using the regular Google search box, for example by typing [linux fedora upgrade]."
