

Scareware, or fake anti-virus attacks, prey on IT security fears and fool users into believing their computer has a problem when it does not. Typically, scareware is planted on websites in the form of pop-up advertisements or disguised downloads. There have also been occasions when hackers have spammed out scareware, or links to it, using traditional social engineering tricks to fool users into clicking on the attachment or link.

"Taking advantage of detailed information about the person's computer and software allows for a much more specific, believable social engineering attempt," said Chester Wisniewski, senior security advisor at Sophos. "We are likely to continue to see these criminals targeting each operating system, browser and any other details that can be gleaned from HTTP requests sent from our devices."

OnLive Player App launched for iPad, Android

OnLive has launched a Player app for iPad and Android. Like the recently announced consoles, the OnLive Player App will enable gameplay of virtually all OnLive games on an iPad and Android tablet with touch or OnLive's new Universal Wireless Controller. In addition, the OnLive Player App allows the tablet to be used as a touch and motion controller combined with an HDTV (or PC/Mac, if preferred), and allows both synchronised or independent video on the tablet and HDTV screen, enabling combined gameplay with tablet and HDTV, or separate gameplay on tablet and HDTV.

It has full voice chat-enabled multiplayer support, both in-room and with others throughout the world, providing a complete multiplayer experience whether at home or on the go with a mobile device.

Core patent-pending exclusive OnLive cloud gaming features such as massive spectating of live gameplay throughout the world, instant no-obsolescence gameplay, Facebook integration with Brag Clip videos, etc, will work on both tablets and HDTVs and will continue to distinguish OnLive from consoles, both in 2011 and beyond.

"The power of the cloud is definitely the theme this week, displacing what had been assumed to be platforms that could never be displaced," said Steve Perlman, founder and CEO, OnLive. "The OnLive Player App for iPad and Android shows how, with the power of the cloud, the question is not whether cloud gaming will be able to catch up to consoles; rather, it will be whether consoles will be able to catch up to cloud gaming."

As part of this experience, the company is also unveiling the first 10 gigabit cloud-based full-featured browsers for the iPad, Android and HDTV; bringing the richness of the Web by loading from ultra-fast 10 gigabit/second Web connections to OnLive's cloud-based servers, including support for full-featured Flash and video sites. Mobile and home devices will no longer be limited to the speed of their local connections for Web browsing or Web plug-in compatibility, opening up access to Flash games and social gaming for tablets and HDTVs.
