

Olive Healthcare Slashes IT Costs by Migrating to Linux OS

Here's a manufacturer that found migrating to Linux to be a breeze, apart from being cost-effective.

Users in small and medium enterprises (SMEs) often have similar requirements in terms of every-day computing needs—a user-friendly operating system, office applications, browsing and email applications, and accounting software. Like many other enterprises, Olive Health Care also had a fairly simple work environment, and used the MS Windows operating system, MS Office applications, Internet applications (Web browsers, email clients, etc), and the PHP and MySQL-based ERP system. As far as hardware devices are concerned, the firm used the Epson and HP printers, and multifunction devices that are generally used by SMEs.

Olive Health Care ventured into the world of soft gelatin formulations by setting up its first manufacturing facility over three decades ago. However, it was only six months back that the company realised that it could bring down costs by implementing Linux in place of Windows. “Linux is not just known as an efficient server operating system, but is now easily adaptable for desktop use also. We knew that migrating to Linux would also mean having to train our staff and acquaint them with the Linux environment,” states Vikram Chauhan, the IT manager. The firm started looking for a Linux-on-desktop solution provider, and the search ended when the Olive IT team interacted with Enjay, a provider of Linux solutions.
