

Build Your Own LAMP Server in Under 10 Minutes

TURNKEY LAMP Stack

Part—1

Many of us have wanted to work on our own homemade Linux Web server, but struggled due to the lack of appropriate versions, and the knowledge to set up PHP support or even dynamic DNS. Well, fear no more; it is no longer rocket science to set up a LAMP stack at your home or office, thanks to virtual appliances from Turnkey Linux. In this article, I walk you through a simple, effective way to set up your own LAMP virtual server, using a pre-configured ISO.

Turnkey Linux (<http://www.turnkeylinux.org/>) is a virtual appliance library that integrates and polishes the very best open source software into ready-to-use solutions. Each virtual appliance is optimised for ease of use, and can be deployed in just a few minutes on bare metal, in a virtual machine, or on the cloud.

Before we get into setting up our own LAMP Virtual Server using a pre-configured ISO, let us evaluate our options.

System requirements

1. Virtual Machine software: VMWare Player or Oracle VirtualBox? For the purposes of this article, we will use the free VMWare Player 3, which can be downloaded

from http://downloads.vmware.com/d/info/desktop_downloads/vmware_player/3_0.

2. Download the LAMP server ISO image from <http://www.turnkeylinux.org/download?file=turnkey-lamp-11.1-lucid-x86.iso> or <http://ncu.dl.sourceforge.net/project/turnkeylinux/turnkey-lamp/11.1-lucid-x86/turnkey-lamp-11.1-lucid-x86.iso>.
3. Once the above ISO has been downloaded, place it on your desktop or home directory.

Installing into a VM

1. Launch VMWare Player.
2. Click the *Create a New Virtual Machine* option.
