

Figure 3: Disk Configuration

Figure 4: Final screen

3. You will now be presented with the *New Virtual Machine Wizard*, as shown in Figure 1, asking for the install source (your optical drive, or an ISO image), or whether you would like to install the OS later. Choose the last option, and click *Next*.
4. In the *Guest Operating System* screen (see Figure 2), choose *Linux*, and *Ubuntu*, and click *Next*.
5. Give the VM a name, and click *Next*.
6. Now, you need to allocate disk space. As you can see in Figure 3, I have chosen 8 GB; feel free to choose whatever is appropriate for your environment, and click *Next*.
7. In the final screen of the wizard (Figure 4), click *Customize Hardware*.
8. We need to set up our Turnkey LAMP ISO as the media

Figure 5: Set up an ISO image location

Figure 6: Install to hard disk – LAMP Stack Boot splash

- to boot from (see Figure 5). Click *New CD/DVD*, and in the *Connection* section, choose *Use ISO image file*; click *Browse* and navigate to the location of the Turnkey Linux LAMP ISO, and choose it.
9. Now, click *OK* twice, and click *Play Virtual Machine*.
10. At the Turnkey Linux boot-loader screen (see Figure 6), choose *Install to Hard disk* and hit *Enter*.
11. Follow the on-screen instructions, and choose to install with auto-partitioning. Choose the second option that shows up, *Guided Partitioning—Use Entire Disk*.
12. When it comes to choosing the GRUB installer, choose *Yes*.
13. When the installation is done, click *Yes* to reboot.
14. Enter the passwords for the *root* and *mysql* users, when prompted.
15. The Backup and Migration utility (TKLBAM) doesn't require setting up an Amazon EC2 instance. It works with local
